PT Array containing probes for genes involved in mitochondrial biology,
PT useful for determining mitochondrial biology gene expression profiles for
PT use in diagnosing pathologies and identifying biochemical pathways.
XX
PS Claim 2; SEQ ID NO 1564; 201pp; English.
XX
CC The invention relates to a novel array comprising at least two isolated
CC nucleotide molecules, each molecule having a sequence capable of uniquely
CC hybridising to a nucleic acid molecule which is an expression product of
CC a gene involved in mitochondrial biology. The array comprises two or more
CC isolated nucleic acid molecules or spots, each molecule having a sequence
CC chosen from sequence of 994 human probes and 2046 mouse probes. An array
CC of the invention is useful for determining an expression profile of a
CC mouse or human sample containing nucleic acid, by contacting the array
CC with the sample under conditions allowing selective hybridisation, and
CC measuring hybridisation of nucleic acid in the sample to the array to
CC produce an expression profile. The array is also useful for determining
CC an expression profile of a first labelled sample containing nucleic acid
CC relative to a second, differently labelled sample containing nucleic
CC acid. The second sample is a reference or a standard. An array is useful
CC for determining an expression profile diagnostic of an energy-metabolism-
CC related physiological condition. An array of the invention is useful for
CC determining mitochondrial biology gene expression profiles of organisms,
CC such as human, mice and closely related species, tissue and organs of
CC such organisms, which are useful for determining expression profiles
CC diagnostic of energy metabolism-related physiological conditions,
CC diagnosing such physiological conditions, identifying biochemical
CC pathways, genes, and mutations involved in such physiological conditions,
CC identifying therapeutic agents useful for preventing and/or treating such
CC physiological conditions, evaluating and/or monitoring the efficacy of
CC such therapies, and creating and identifying animal models of human
CC energy metabolism-related physiological conditions. An array is also
CC useful for defining expression signatures or profiles for mitochondrial
CC diseases, as well as distinguishing clinical disorders that result from
CC oxidative phosphorylation (OXPHOS) dysfunction, oxidative stress,
CC apoptosis and aging. An array of the invention contains probes of genes
CC not previously recognised to participate in mitochondrial biology. The
CC sequences shown in ADD33224-ADD35260 represent murine mitochondrial DNA
CC clones used to make the probes of the invention. Some sequences are not
CC present, these are SEQ ID NO's 295, 1174, 1213, 1700, 1728, 1730, 1905,
CC 1906, 2408 and 2643.

PT Detecting single nucleotide polymorphism involves amplifying target
PT sequences using small primer probe that matches or mismatches to target
PT sequence and extending primer probe which is then detected.
XX
PS Claim 15; Page 41; 67pp; English.
XX
CC The invention relates to detecting single nucleotide polymorphisms by
CC contacting an allele-specific oligonucleotide primer (P1) with a target
CC polynucleotide to form a hybridisation complex, where the target sequence
CC is complementary to P1 at one end but the terminal nucleotide and the
CC third nucleotide from the terminal at the other end of P1 may not be
CC complementary. The complex is then contacted with an exonuclease
CC deficient DNA polymerase enzyme under conditions that promote extension
CC of P1 with the target DNA as the template, thereby forming an extended
CC segment of P1. Oligonucleotide probes hybridising to one or more target
CC polynucleotides distinguish between matched and mismatched 3' ends, hence
CC the absence of sequence amplification indicates the presence of a single
CC nucleotide mismatch. Primer sequences complementary to a sequence on an
CC amplification target circle can be used in rolling circle amplification
CC (RCA). The method is useful for diagnosing a disease caused by, induced
CC by or related to a mutation in at least one gene, such as Parkinson's
CC disease, polycystic kidney disease, Tay-Sachs disease, Huntington
CC disease, sickle cell anaemia, haemophilia, cystic fibrosis, diabetes,
CC obesity, cancers of the head, neck, skin, brain, oesophagus, stomach,
CC lung, breast, colon, ovary, testis or prostate, leukaemia, lymphoma and
CC melanoma. Sequences AAS95711-AAS95745 represent primers, targets and
CC fluorescence decorators used in the detection of RCA products

PT   Detecting target polynucleotide in a sample, by amplifying target,
PT   hybridizing it to oligonucleotides bound to nanoparticles in nanoparticle
PT   detection system, and determining amount of signal generated due to
PT   binding.
XX
PS   Example 1; Page 35; 74pp; English.
XX
CC   The sequences given in ABQ80394-99 represent probes and targets which
CC   were used in the method of the invention for detecting a target
CC   polynucleotide in a sample. The method comprises amplifying the target,
CC   hybridizing the target to oligonucleotides bound to nanoparticles in a
CC   nanoparticle detection system, determining the amount of signal generated
CC   as a result of binding, optionally repeating the above steps, and
CC   detecting the presence of the target oligonucleotide by analysing for the
CC   amount of signal produced after at least one amplification cycle. The
CC   method is useful for detecting target polynucleotide in a sample, and for
CC   determining the quantity of target polynucleotide in a sample. The method
CC   is useful in research and analytical laboratories in DNA sequencing, in
CC   the field to detect the presence of specific pathogens, in the doctor's
CC   office for quick identification of an infection to assist in prescribing
CC   a drug for treatment, and in homes and health centres for inexpensive
CC   first-line screening. The method is based on observing colour change with
CC   the naked eye, hence the method is cheap, fast, simple, robust, do not
CC   require specialized or expensive equipment, and little or no
CC   instrumentation is required

PT   An improved multiplex ligation-dependent amplification method for
PT   detecting specific single stranded target nucleic acids in samples.
XX
PS   Example 8; Page 137; 158pp; English.
XX
CC   The invention relates to an improved multiplex ligation-dependent
CC   amplification method for detecting specific single stranded target
CC   nucleic acids in samples using a plurality of probe sets comprising at
CC   least 2 probes. Each probe comprises a target specific region and a non-
CC   complementary region comprising a primer binding site. The probes in each
CC   set are ligated when hybridised to a target nucleic acid and amplified by
CC   a primer set. The method is used for detecting a nucleotide polymorphism,
CC   especially a single nucleotide polymorphism; detecting multiple single
CC   stranded target nucleic acid sequences (through the detection of multiple
CC   amplicons); determining the absolute or relative abundance of multiple
CC   single stranded nucleic acids in a sample; and detection of a break point
CC   region in rearranged nucleic acids. By using a femtomolar amount of the
CC   probes, a large number of different probe sets can be used to
CC   simultaneously detect and quantify a corresponding large number of target
CC   sequences with high specificity. The present DNA sequence is biotin-dT3
CC   labelled fluorescent oligonucleotide which is used for the hybridisation
CC   selection reaction of human mRNA samples

PT   Polymorphic nucleic acids encoding e.g. amylases, cyclins, polymerases,
PT   oncogenes and histones, useful for diagnosing and treating, e.g. cancer,
PT   autoimmune diseases and infections.
XX
PS   Claim 1; Page 2871; 4143pp; English.
XX
CC   The present invention relates to oligonucleotides encoding polymorphic
CC   variants of proteins related to amylases, amyloid proteins, angiopoietin,
CC   apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes,
CC   histones, kinases, colony stimulating factors, complement related
CC   proteins, cytochromes, kinesins, cytokines, interferons, interleukins, G-
CC   protein coupled receptors and thioesterases. The present sequence is one
CC   such oligonucleotide. The oligonucleotides and the peptides encoded by
CC   them may be used in the prevention, diagnosis and treatment of diseases
CC   associated with inappropriate expression of the proteins listed above.
CC   Disorders that may be prevented, diagnosed and/or treated include
CC   multifactorial diseases with a genetic component, such as autoimmune
CC   diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes,
CC   systemic lupus erythromatosus and Grave's disease), inflammation, cancer
CC   (e.g. cancers of the bladder, brain, breast, colon and kidney,
CC   leukaemia), diseases of the nervous system and an infection of pathogenic
CC   organisms

PT   Enhancing translation of coding region of hepatitis C virus involves
PT   making RNA molecule comprising the coding region and 5' untranslated
PT   region comprising a sequence fully homologous to pestivirus homology box
PT   IV.
XX
PS   Disclosure; Col 19-20; 16pp; English.
XX
CC   This invention describes a novel method for enhancing translation of a
CC   coding region which involves making an RNA molecule, comprising the
CC   coding region operably linked to a 5' untranslated region (UTR)
CC   comprising a sequence fully homologous to pestivirus homology box IV, and
CC   then translating it so that the translation of the coding region is
CC   enhanced. The method is useful for enhancing or controlling the
CC   translation of HCV nucleic acid, which allows stronger immune responses,
CC   where blocking or decreasing translation of viral nucleic acid may
CC   decrease the pathology of viral infection. This sequence represents a
CC   primer which is used in the construction of hybrid CAT RNA's described in
CC   the method of the invention

PT   Novel replicase complex comprising hepatitis C virus NS5B replicase, a 3
PT   nucleotide-long template to which a 2 nucleotide-long primer is annealed,
PT   and template and primer which do not form a stable duplex in the absence
PT   of HCV NS5B.
XX
PS   Example; Page 6; 17pp; English.
XX
CC   The invention relates to a replicase complex comprising a hepatitis C
CC   virus (HCV) NS5B replicase protein, a linear nucleic acid template and a
CC   complementary nucleic acid primer which is annealed to the 3' terminus of
CC   the template, where the template is at least three nucleotides and the
CC   primer is two or three nucleotides, and the template and primer do not
CC   form a stable duplex in solution in the absence of the HCV NS5B protein.
CC   The complex is useful for detecting HCV replicase activity and permits
CC   establishment of sensitive RNA-dependent RNA polymerase assays to screen
CC   and evaluate antiviral inhibitors and to improve the specificity and
CC   efficacy of the inhibitors. The complex is also useful in the development
CC   of a reliable system for determining kinetic and thermodynamic constants
CC   of HCV NS5B-catalysed nucleotide incorporation and investigation of
CC   mechanistic inhibitors for mis-incorporation or chain termination.
CC   Specifically, the short RNA template and primer pairs are useful in
CC   screening assays which are used for determining kinetic, thermodynamic
CC   and mechanistic properties of NS5B replication and ultimately in the
CC   development of inhibitors of NS5B. Newly identified inhibitors of
CC   replicase activity may be used for developing anti-HCV pharmaceuticals.
CC   Sequences ABK99271-ABK99296 represent HCV NS5B replicase RNA synthesis
CC   templates

PT   template with unstable, small stemloop capable of forming copy-back
PT   structure, viral non-structural protein 5B, nucleoside triphosphates,
PT   buffer.
XX
PS   Example 1; Fig 1A; 10pp; English.
XX
CC   The present invention relates to an assay system for hepatitis C virus
CC   (HCV) replicase activity. The assay system comprises an RNA template that
CC   has an unstable, small stemloop at the 3' end capable of forming a copy-
CC   back structure, a HCV non-structural protein 5B (NS5B), ATP, GTP, CTP,
CC   and UTP nucleoside triphosphates (NTPs), where one of the NTP is
CC   radiolabelled and an assay buffer that supports replication activity of
CC   NS5B. The invention also relates to the identification of optimal
CC   properties of an RNA template for copy-back self-priming RNA synthesis of
CC   HCV. This activity can be used to screen for anti-HCV replicase compounds
CC   or to characterise the biological relevance of lead compounds. The
CC   optimal RNA templates can be used for developing a system to characterise
CC   HCV NS5B polymerase mechanistically and kinetically and for designing
CC   small RNA molecules to co-crystallise with HCV NS5B polymerase. The assay
CC   system of the invention is useful for detecting HCV replicase activity.
CC   The nucleic acid synthesised by NS5B is detected by evaluating an
CC   autoradiograph of reaction products separated by gel electrophoresis. The
CC   present sequence is RNA template, AU used to direct RNA synthesis by RNA
CC   polymerase proteins of HCV, BVDV and polivirus. This sequence is used in
CC   the exemplification of the invention

PT   New antisense compound targeted to a nucleic acid molecule encoding
PT   transcription factor-2 gamma, useful for inhibiting expression of the
PT   nucleic acid, and for treating cancer e.g. breast cancer or colon cancer.
XX
PS   Example 14; Page 77; 107pp; English.
XX
CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of transcription factor-2 gamma (TFAP2C).
CC   TFAP2C is also known as AP-2 gamma, AP2-gamma, AP-2.2, Stra2, activating
CC   enhancer-binding protein 2 gamma, oestrogen receptor factor-1 and ERF-1.
CC   The invention is useful for inhibiting the expression of TFAP2C in cells
CC   or tissues. It is useful for treating an animal having a disease or
CC   condition associated with TFAP2C, e.g., a hyperproliferative disorder
CC   such as cancer e.g. breast cancer or colon cancer and a developmental
CC   disorder. The invention is also useful for diagnostics, therapeutics,
CC   prophylaxis and as research reagents and kits. It is also used in
CC   antisense therapy. The present sequence is a PCR probe specific for human
CC   TFAP2C DNA. This sequence is used to illustrate the method of the
CC   invention

PT   Detecting target polynucleotide in a sample, by amplifying target,
PT   hybridizing it to oligonucleotides bound to nanoparticles in nanoparticle
PT   detection system, and determining amount of signal generated due to
PT   binding.
XX
PS   Example 1; Page 35; 74pp; English.
XX
CC   The sequences given in ABQ80394-99 represent probes and targets which
CC   were used in the method of the invention for detecting a target
CC   polynucleotide in a sample. The method comprises amplifying the target,
CC   hybridizing the target to oligonucleotides bound to nanoparticles in a
CC   nanoparticle detection system, determining the amount of signal generated
CC   as a result of binding, optionally repeating the above steps, and
CC   detecting the presence of the target oligonucleotide by analysing for the
CC   amount of signal produced after at least one amplification cycle. The
CC   method is useful for detecting target polynucleotide in a sample, and for
CC   determining the quantity of target polynucleotide in a sample. The method
CC   is useful in research and analytical laboratories in DNA sequencing, in
CC   the field to detect the presence of specific pathogens, in the doctor's
CC   office for quick identification of an infection to assist in prescribing
CC   a drug for treatment, and in homes and health centres for inexpensive
CC   first-line screening. The method is based on observing colour change with
CC   the naked eye, hence the method is cheap, fast, simple, robust, do not
CC   require specialized or expensive equipment, and little or no
CC   instrumentation is required

PT   PTAN proteins, and sequences encoding them, used for diagnosing and
PT   treating cancers, especially breast and prostate cancers.
XX
PS   Example 1; Page 31; 71pp; English.
XX
CC   This sequence represents a primer used in the isolation of cDNA fragments
CC   of the PTAN (testis specific protein expressed in prostate cancer) gene.
```

```
CC   PTAN is expressed in 3 isoforms PTAN-1, 2, and 3. The PTAN gene is
CC   located on chromosome 1q22. PTAN is overexpressed in prostate cancer, and
CC   has a testis specific expression pattern in adult tissues. PTAN shows no
CC   homology to any known gene. PTAN can be used in methods for the diagnosis
CC   of cancer, especially prostate or breast cancer, where the normal tissue
CC   samples are prostate tissue, or breast tissue, bone tissue, lymphatic
CC   tissue, serum, blood, or urine. A vector containing the PTAN nucleotide
CC   sequence, a vaccine composition targeting PTAN, PTAN, ribozymes specific
CC   for PTAN mRNA and antisense sequences, can be used to treat cancer,
CC   especially breast and prostate cancers. Cancer development can be
CC   inhibited by a vaccine composition targeting PTAN

PT   Synthetic nucleic acid probes - comprising two nucleic acid sequences
PT   linked by a scissile linkage.
XX
PS   Example; p29; 46pp; English.
XX
CC   The patent claims a new molecule of formula (NA1----S----NA2)n. NA1 and
CC   NA2 are noncomplementary nucleic acid sequences; ---S--- = a scissile
CC   linkage; n= 1 or 1,000, which is used for the detection of specific DNA
CC   or RNA sequences in a test soln. The scissile link probes may be PL
CC   (Permanent Linkage to Solid Support) or HL (Hydrolysable Linkage to Solid
CC   Support). The differential liability of DNA and RNA may be exploited in a
CC   heterogenous system when the scissile linkage is an RNA molecule. In the
CC   examples, counter probe molecules 9 through 16 were used to determine
CC   suitable hybridisation conditions. (Updated on 03-OCT-2002 to add missing
CC   OS field.)

PT   Detecting target nucleic acid molecules - using excess complementary
PT   nucleic acid probes and nicking to complete a cycling sequence.
XX
PS   Disclosure; Page 24; 34pp; English.
XX
CC   Probe MRC068 is bound by a hydrolysable linkage to a solid support at its
CC   3' end. It is used by reacting excess probe with a target nucleic acid;
CC   nicking hybridised probe at least once within a predetermined sequence to
CC   form 2 or more probe fragments hybridised to the target sequence, which
CC   results in the probe fragments becoming hybridised to another probe; and
CC   identifying probe fragments, so detecting the target sequence. The probe
CC   can react with target sequence to complete a cycling sequence. Using this
CC   system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can
CC   be obtd. The probe is cleavable at the ribonucleotides by a ds RNase, eg
CC   RNase H or ExoIII. (Updated on 31-OCT-2002 to add missing OS field.)

PT Detecting a label comprising employing (as the label) a reagent having a
PT 3' extendable terminus hybridized to a tandem repeat template in
PT combination with a DNA polymerase and dNTPs necessary for repetitively
PT replicating the tandem repeat.
XX
PS Example; SEQ ID NO 2; 38pp; English.
XX
CC The invention relates to a method for detecting a label, comprising
CC employing (as the label) a reagent having a 3' extendable terminus
CC hybridised to a tandem repeat template in combination with a DNA
CC polymerase and dNTPs necessary for repetitively replicating the tandem
CC repeat. The method involves detecting a binding event between first and
CC second binding members, employing a label to determine the occurrence of
CC the binding event. The tandem repeating units are polyT. The method of
CC the invention is useful in detecting an analyte using repetitive
CC extension along a tandem repeat. The extended nucleic acid may be used
CC for detecting a moiety, particularly involved in a binding event
CC employing a reagent. The current sequence represents a template member
CC oligonucleotide containing a polyT tandem repeat that binds to the
CC extendable oligonucleotide given in ADC33444.

PT Kit for the detection and typing of small round-structured virus (SRSV)
PT strains for investigation of food poisoning outbreaks, contains
PT antibodies.
XX
PS Example 1; Page 75; 84pp; Japanese.
XX
CC This invention relates to a kit for the detection and typing of small
CC round structured virus (SRSV) strains. The kit contains antibodies
CC directed against peptides represented in sequences AAB49700 - AAB49710,
CC which are each SRSV strain specific. Polynucleotide sequences AAF20141 -
CC AAF20151 represent cDNA encoding the strain specific proteins. The kit is
CC used for detecting and typing strains of SRSV in order to prevent the
CC spread of infection and to examine the epidemiology of outbreaks. PCR
CC primers AAF29152 - AAF29163 are used to amplify SRSV strain specific cDNA

PT Novel replicase complex comprising hepatitis C virus NS5B replicase, a 3
PT nucleotide-long template to which a 2 nucleotide-long primer is annealed,
PT and template and primer which do not form a stable duplex in the absence
PT of HCV NS5B.
XX
PS Example; Page 6; 17pp; English.
XX
CC The invention relates to a replicase complex comprising a hepatitis C
CC virus (HCV) NS5B replicase protein, a linear nucleic acid template and a
CC complementary nucleic acid primer which is annealed to the 3' terminus of
CC the template, where the template is at least three nucleotides and the
CC primer is two or three nucleotides, and the template and primer do not
CC form a stable duplex in solution in the absence of the HCV NS5B protein.
CC The complex is useful for detecting HCV replicase activity and permits
CC establishment of sensitive RNA-dependent RNA polymerase assays to screen
CC and evaluate antiviral inhibitors and to improve the specificity and
CC efficacy of the inhibitors. The complex is also useful in the development
CC of a reliable system for determining kinetic and thermodynamic constants
CC of HCV NS5B-catalysed nucleotide incorporation and investigation of
CC mechanistic inhibitors for mis-incorporation or chain termination.
CC Specifically, the short RNA template and primer pairs are useful in
CC screening assays which are used for determining kinetic, thermodynamic
CC and mechanistic properties of NS5B replication and ultimately in the
CC development of inhibitors of NS5B. Newly identified inhibitors of
CC replicase activity may be used for developing anti-HCV pharmaceuticals.
CC Sequences ABK99271-ABK99296 represent HCV NS5B replicase RNA synthesis
CC templates

PT   Assay system for hepatitis C virus replicase activity comprises RNA
PT   template with unstable, small stemloop capable of forming copy-back
PT   structure, viral non-structural protein 5B, nucleoside triphosphates,
PT   buffer.
XX
PS   Example 1; Fig 1A; 10pp; English.
XX
CC   The present invention relates to an assay system for hepatitis C virus
CC   (HCV) replicase activity. The assay system comprises an RNA template that
CC   has an unstable, small stemloop at the 3' end capable of forming a copy-
CC   back structure, a HCV non-structural protein 5B (NS5B), ATP, GTP, CTP,
CC   and UTP nucleoside triphosphates (NTPs), where one of the NTP is
CC   radiolabelled and an assay buffer that supports replication activity of
CC   NS5B. The invention also relates to the identification of optimal
CC   properties of an RNA template for copy-back self-priming RNA synthesis of
CC   HCV. This activity can be used to screen for anti-HCV replicase compounds
CC   or to characterise the biological relevance of lead compounds. The
CC   optimal RNA templates can be used for developing a system to characterise
CC   HCV NS5B polymerase mechanistically and kinetically and for designing
CC   small RNA molecules to co-crystallise with HCV NS5B polymerase. The assay
CC   system of the invention is useful for detecting HCV replicase activity.
CC   The nucleic acid synthesised by NS5B is detected by evaluating an
CC   autoradiograph of reaction products separated by gel electrophoresis. The
CC   present sequence is RNA template, AA used to direct RNA synthesis by RNA
CC   polymerase proteins of HCV, BVDV and polivirus. This sequence is used in
CC   the exemplification of the invention

XX
PT   Detection of DNA polymorphism by mass spectroscopy for investigation and
PT   diagnosis of gene-related diseases.
XX
PS   Example 3; Page 28; 34pp; Japanese.
XX
CC   The present invention describes a method for detecting polymorphisms in
CC   DNA by: (a) preparing a DNA sample from patients containing the DNA
CC   region in which the target polymorphism is located; (b) hybridising to an
CC   appropriate oligonucleotide fragment, immobilised on a support; and (c)
CC   detecting the hybridised target DNA by mass spectroscopy. The method can
CC   be used for the investigation and diagnosis of gene-related diseases. The
CC   method allows polymorphisms to be detected rapidly and effectively in a
CC   large number of specimens. The present sequence represents an
CC   oligonucleotide which is used in an example from the present invention

PT   Identifying individuals having a polymorphism, useful for determining the
PT   effectiveness or side effect of a drug or treatment protocol, comprises
PT   detecting at least one polymorphism in the drug metabolizing enzyme
PT   nucleic acid.
XX
PS   Claim 23; Page 116; 2785pp; English.
XX
CC   Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes
CC   encoding enzymes associated with drug metabolism. The invention relates
CC   to methods and compositions for identifying individuals who have at least
CC   one polymorphism in such drug metabolising enzyme-encoding genes. The
CC   polymorphisms may be identified in a nucleic acid sample using probes or
CC   primers specific for a sequence selected from ABZ43217-ABZ50887 using a
CC   variety of detection assays, including hybridisation assays, nucleic acid
CC   arrays and PCR-based methods. The invention also encompasses methods of
CC   evaluating and screening drugs using genetic polymorphism data. Genetic
CC   polymorphism data, particularly that relating to single nucleotide
CC   polymorphisms (SNPs), may be used in studying the relationship between
CC   DNA sequence variations and human diseases, conditions, and responses to
CC   drugs. SNPs are also useful as polymorphism markers for discovering genes
CC   that cause or exacerbate certain diseases. SNPs are particularly useful
CC   in the above respects as they are stable in populations, occur
CC   frequently, and have lower mutation rates than other genome variations
CC   such as repeating sequences. The detection and analysis of polymorphisms
CC   in genes encoding drug metabolising enzymes allows the customisation of
CC   drug therapies based upon the genetic profile of individual patients.
CC   This would not only take the guesswork out of selecting the drug with the
CC   greatest therapeutic effect for a particular patient, but would also
CC   reduce the likelihood of adverse reactions, thereby increasing safety.
CC   Methods of the invention are also useful in the drug discovery and
CC   approval processes. For example, individuals could be selected for
CC   clinical trials only if their genetic profiles indicate that they are
CC   capable of responding to a particular drug or drug class, and previously
CC   failed drug candidates could be revived if they were matched with more
CC   appropriate patient populations. The methods, data and compositions of
CC   the invention may therefore lead to a an increase in the range of
CC   possible drug targets and decreases in the number of adverse drug
CC   reactions, failed drug trials, the time taken for a drug to be approved,
CC   the length of time patients are on medication and the number of different
CC   medications a patient needs to take before finding an effective therapy

PT   New antisense compound targeted to a nucleic acid molecule encoding
PT   transcription factor-2 gamma, useful for inhibiting expression of the
PT   nucleic acid, and for treating cancer e.g. breast cancer or colon cancer.
XX
PS   Example 14; Page 77; 107pp; English.
XX
CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of transcription factor-2 gamma (TFAP2C).
CC   TFAP2C is also known as AP-2 gamma, AP2-gamma, AP-2.2, Stra2, activating
CC   enhancer-binding protein 2 gamma, oestrogen receptor factor-1 and ERF-1.
CC   The invention is useful for inhibiting the expression of TFAP2C in cells
CC   or tissues. It is useful for treating an animal having a disease or
CC   condition associated with TFAP2C, e.g., a hyperproliferative disorder
CC   such as cancer e.g. breast cancer or colon cancer and a developmental
CC   disorder. The invention is also useful for diagnostics, therapeutics,
CC   prophylaxis and as research reagents and kits. It is also used in
CC   antisense therapy. The present sequence is a PCR primer specific for
CC   human TFAP2C DNA. This sequence is used to illustrate the method of the
CC   invention

PT   Assay system for hepatitis C virus replicase activity comprises RNA
PT   template with unstable, small stemloop capable of forming copy-back
PT   structure, viral non-structural protein 5B, nucleoside triphosphates,
PT   buffer.
XX
PS   Example 1; Fig 2A; 10pp; English.
XX
CC   The present invention relates to an assay system for hepatitis C virus
CC   (HCV) replicase activity. The assay system comprises an RNA template that
CC   has an unstable, small stemloop at the 3' end capable of forming a copy-
CC   back structure, a HCV non-structural protein 5B (NS5B), ATP, GTP, CTP,
CC   and UTP nucleoside triphosphates (NTPs), where one of the NTP is
CC   radiolabelled and an assay buffer that supports replication activity of
CC   NS5B. The invention also relates to the identification of optimal
CC   properties of an RNA template for copy-back self-priming RNA synthesis of
CC   HCV. This activity can be used to screen for anti-HCV replicase compounds
CC   or to characterise the biological relevance of lead compounds. The
CC   optimal RNA templates can be used for developing a system to characterise
CC   HCV NS5B polymerase mechanistically and kinetically and for designing
CC   small RNA molecules to co-crystallise with HCV NS5B polymerase. The assay
CC   system of the invention is useful for detecting HCV replicase activity.
CC   The nucleic acid synthesised by NS5B is detected by evaluating an
CC   autoradiograph of reaction products separated by gel electrophoresis. The
CC   present sequence is RNA template, (AU)3 used to direct RNA synthesis by
CC   RNA polymerase proteins of HCV, BVDV and polivirus. This sequence is used
CC   in the exemplification of the invention

PT   Rolling circle synthesis of oligo:nucleotide(s) - using primed circular
PT   template to produce oligonucleotide multimer for cleavage.
XX
PS   Example 2; Col 45; 38pp; English.
XX
CC   The present sequence represents an oligonucleotide used in an example of
CC   the present invention. The present invention describes a method for
CC   synthesising a selected oligonucleotide (I) having well defined ends. The
CC   method comprises: (a) annealing a primer to a single-stranded (ss)
CC   circular template to yield a primed circular template, where the template
CC   comprises: (i) at least one nucleotide sequence complementary to (I); and
CC   (ii) at least one nucleotide effective to produce a cleavage site in the
CC   oligonucleotide multimer; (b) combining the primed circular template with
CC   at least two types of nucleotide triphosphates and a polymerase enzyme
CC   without the addition of auxiliary proteins to yield a ss oligonucleotide
CC   multimer complementary to the circular oligonucleotide template,
CC   comprising multiple copies of (I); and (c) cleaving the oligonucleotide
CC   multimer at the cleavage site to produce (I) having well defined ends.
CC   The method is used for the large-scale synthesis of DNA and RNA oligomers
CC   for use, e.g. as probes and diagnostic agents and/or therapeutic agents

PT   New detectably labelled oligonucleotide multimer, comprising multiple
PT   contiguous copies of a repeated oligonucleotide - useful for detecting
PT   target molecules in diagnosis and medicinal applications.
XX
PS   Example 2; Page 41; 103pp; English.
XX
CC   The present invention describes a detectably labelled oligonucleotide
CC   multimer, comprising multiple contiguous copies of a repeated
CC   oligonucleotides. The detectably labelled oligonucleotide multimer is
```

```
CC   useful for detecting a target molecule. Oligonucleotide multimers may be
CC   produced in sufficient quantity to be useful for diagnostic and medical
CC   applications. The multimers are useful for affinity labelling of
CC   proteins, and for signal amplification in highly sensitive affinity
CC   capture and sequence identification applications. The method provides a
CC   faster, cheaper and simpler way for large-scale production of DNA and RNA
CC   oligomers and multimers. The incorporation of labels enables the
CC   oligonucleotide multimers to be useful in diagnostics and medicine. The
CC   present sequence represents an oligonucleotide used in an example from
CC   the present invention

PT   New phospho:di:esteric oligo:nucleotide(s) - which exert a specific and
PT   selective cytotoxic effect on tumour cells, for treating both solid and
PT   liquid tumours.
XX
PS   Claim 10; Page 6; 38pp; English.
XX
CC   Novel phosphodiesteric oligonucleotides AAT93811-27 are based on the
CC   generic formula, in the 3'-5' or 5'-3' direction: (GaTa')a''-(GbTb')b''-
CC   (GcTc')c''-(GdTd')d''-(GeTe')e''-(GfTf')f''- (G-gTg')g''-N', where: N and
CC   N' = T or G, equal or different from each other; x = 0-8, equal or
CC   different from each other; a, b, c, d, e, f, and g = 0-10, equal or
CC   different from each other; a', b', c', d', e', f', and g' = 0-30, equal
CC   or different from each other; a'', b'', c'', d'', e'', f'', and g'' = 1-
CC   16, equal or different from each other; The oligonucleotides are believed
CC   to selectively bind and sequester some proteins which are essential to
CC   the viability and growth of tumoural cell line. They have specific and
CC   selective cytotoxic activity against tumour cells, and can be used for
CC   treating tumours of the liquid type, in particular of lymphoblastic
CC   origin, and of solid type, in particular lymphomas. The present
CC   phosphodiester oligonucleotide, at a concentration of 15 micromolar,
CC   reduced growth of CCRF-CEM tumoural cells by 71%, which is detectable 48
CC   hours after administration. (Updated on 25-MAR-2003 to correct PR field.)

PT   New pure contryphan peptides.
XX
PS   Example 3; Page 20; 48pp; English.
XX
CC   The present sequence sequence represents a PCR primer for a contryphan
CC   peptide sequence. Contryphan peptides are found in the venom of cone
```

CC snails. The contryphan peptides are useful as anticonvulsant agents, as
CC neuroprotective agents, for managing pain, and for treating
CC neurodegenerative disorders, especially those resulting from an
CC overstimulation of excitatory amino acid receptors. The contryphans are
CC useful for the treatment and alleviation of epilepsy and as a general
CC anticonvulsant agent. The contryphans are also useful to reduce
CC neurotoxic injury associated with conditions of hypoxia, anoxia, or
CC ischaemia which typically follows stroke, cerebrovascular accident, brain
CC or spinal chord trauma, myocardial infarct, physical trauma, drownings,
CC suffocation, perinatal asphyxia, or hypoglycaemic events. The contryphans
CC are further useful for the treatment of Alzheimer's disease, senile
CC dementia, amyotrophic lateral sclerosis, Parkinson's disease,
CC Huntington's disease, Down's syndrome, Korsakoff's disease,
CC schizophrenia, AIDS dementia, multi-infarct dementia, and neuronal damage
CC associated with uncontrolled seizures. The contryphans are further useful
CC in controlling pain and are effective in the treatment of migraine. They
CC can be used prophylactically or to relieve the symptoms associated with a
CC migraine episode

PT Selective elimination of non-targeted DNA sequences for rapid isolation
PT and enrichment of the differences of DNA fragments between two pools of
PT DNA, comprises converting testers to drivers.
XX
PS Claim 6; Col 5; 23pp; English.
XX
CC The invention comprises rapid isolation and enrichment of the differences
CC of DNA fragments between two pools of DNA, comprises converting
CC undesirable testers (DNA being subtracted) to drivers (DNA used to
CC subtract) and re-utilising converted drivers in repeats of subtraction to
CC achieve double exponential elimination of undesirable tester sequences.
CC The method comprises (a) attaching a nucleic acid fragment to 1 or more
CC polymerase chain reaction (PCR) adapters to form an adapter-attached
CC nucleic acid fragment, followed by amplifying the adapter-attached
CC nucleic acid fragment through PCR with primers containing nucleic acid
CC sequences complementary to nucleic acid sequences of the adapter to form
CC an adapter-attached nucleic acid tester, (b) mixing the adapter-attached
CC nucleic acid tester with a nucleic acid driver that contains no attached
CC adapter or contains an attached adapter whose sequence differs from the
CC adapter, to form a nucleic acid mixture, (c) denaturing and re-annealing
CC the tester/driver nucleic acid mixture, (d) adding to the nucleic acid
CC mixture an effective amount of reagents necessary for removing the
CC adapter sequence from the tester/ driver hetero-duplex and (e) repeating
CC step (c) to (d) at least once (no amplification takes place and no
CC additional driver is added). The method is used for rapid isolation and
CC enrichment of the differences of DNA fragments between two pools of DNA
CC e.g. in the search for tumour specific sequences. The method has 2
CC improvements over the methods disclosed by Yang et al. (1996), Lisitsyn
CC et al. (1993), Straus et al. (1990) by (i) bypassing the need of a
CC polymerase chain reaction (PCR) amplification or physical separation of
CC desirable testers from undesirable ones in each repeat of subtraction, it
CC eliminates the necessity of tester dilution in each repeat of
CC subtraction, and (ii) by utilising the convened driver from each repeat
CC of subtraction, it eliminates the need for re-introducing additional
CC driver into hybridisation in each repeat of subtraction. The present
CC sequence is an Oligo D(T) PCR primer used in the method of the invention

CC   The present invention relates to fibrinolytic enzyme, brevinase (see
CC   AAG79000), which is separated from the poison of Agkistordon blomhoffi
CC   brevicaudus (mamushi). The enzyme shows stability at high temperatures
CC   and is thus useful in developing thrombolytic agents. The present
CC   sequence is a PCR primer, which was used in an example from the present
CC   invention. (Updated on 11-SEP-2003 to standardise OS field)

PT   Synthetic nucleic acid probes - comprising two nucleic acid sequences
PT   linked by a scissile linkage.
XX
PS   Example; p29; 46pp; English.
XX
CC   The patent claims a new molecule of formula (NA1----S----NA2)n. NA1 and
CC   NA2 are noncomplementary nucleic acid sequences; ---S--- = a scissile
CC   linkage; n= 1 or 1,000, which is used for the detection of specific DNA
CC   or RNA sequences in a test soln. The scissile link probes may be PL
CC   (Permanent Linkage to Solid Support) or HL (Hydrolysable Linkage to Solid
CC   Support). The differential liability of DNA and RNA may be exploited in a
CC   heterogenous system when the scissile linkage is an RNA molecule. In the
CC   examples, counter probe molecules 9 through 16 were used to determine
CC   suitable hybridisation conditions. (Updated on 03-OCT-2002 to add missing
CC   OS field.)

PT   Detecting target nucleic acid molecules - using excess complementary
PT   nucleic acid probes and nicking to complete a cycling sequence.
XX
PS   Disclosure; Page 24; 34pp; English.
XX
CC   Probe MRCO64 is bound by a hydrolysable linkage to a solid support at its
CC   3' end. It is used by reacting excess probe with a target nucleic acid;
CC   nicking hybridised probe at least once within a predetermined sequence to
CC   form 2 or more probe fragments hybridised to the target sequence, which
CC   results in the probe fragments becoming hybridised to another probe; and
CC   identifying probe fragments, so detecting the target sequence. The probe
CC   can react with target sequence to complete a cycling sequence. Using this
CC   system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can
CC   be obtd. The probe is cleavable at the ribonucleotides by a ds RNase, eg
CC   RNase H or ExoIII. (Updated on 31-OCT-2002 to add missing OS field.)

PT   Optical detection of hybridization complexes for specific target nucleic
PT   acid sequences.
XX
PS   Example 1; Page 40; 46pp; English.
XX
CC   This invention describes a novel method for the visual detection of
CC   target nucleic acid presence in a sample. A preferred target is a
CC   Mycobacterium complex nucleic acid sequence. The detection method uses
CC   visual detection of a change in the hybridization without aid of
CC   instrumentation. Multiple copies of a target nucleic acid sequence are
CC   mixed with first and second detectable probes under hybridizing
CC   conditions favouring particle agglutination via a bridging molecule
CC   allowing for visual detection of the target nucleic acid sequence. The
CC   bridging molecule enhances or inhibits formation of a hybridization
CC   complex

PT   Determining an analyte in a sample, for generating multiple double
PT   stranded nucleic acids, comprises employing a single primer sequence with
PT   a nucleobase sequence having affinity to the sequence contained in a
PT   target nucleic acid.
XX
PS   Example 1; Col 14; 25pp; English.
XX
CC   The invention relates to determining an analyte in a sample comprising
CC   (a) providing a target nucleic acid comprising a region A, a nucleobase
CC   sequence B, and a sequence I linked to the 5' terminus of the nucleobase
CC   sequence B, where the nucleobase sequence B is not specific for the
CC   analyte, and the region A specifically binds to the analyte, (b) binding
CC   the target nucleic acid to the analyte, separating the analyte bound to
CC   the target nucleic acid from the remaining part of the sample, (d)
CC   hybridising a primer to the target nucleic acid, where the primer
CC   comprises a nucleobase sequence B', and the nucleobase sequence B'
CC   hybridises to the nucleobase sequence B, (e) elongating the hybridised
CC   primer to produce an elongation product E using the target nucleic acid
CC   as a template and using nucleotides, where at least 30 % of the
CC   nucleotides contain at least one promiscuous base which is capable of
CC   base pairing with each of adenine, guanine, cytosine, and thymine, (f)
CC   separating the target nucleic acid from the elongation product E, (g)
CC   hybridising a further primer which comprises the nucleobase sequence B'
CC   to the elongation product E, where the elongation product E is capable of
CC   acting as a template for the elongation of the further primer, (h)
CC   elongating the hybridised further primer of step (g) to produce an
CC   elongation product E' using the elongation product E as a template and
CC   using nucleotides, where at least 30 % of the nucleotides contain at
CC   least one promiscuous base, (i) separating the elongation product E from
CC   the elongation product E', (j) hybridising a further primer comprising a
CC   nucleobase sequence B' to the target nucleic acid or the elongation
CC   product E, (k) elongating the further primer of step (j) to produce
CC   another elongation product E using the target nucleic acid or elongation
CC   product E as a template and using nucleotides, where at least 30 % of the
CC   nucleotides contain at least one promiscuous base, (l) separating product
CC   E of step (k) from the target nucleic acid or elongation product E, (m)
CC   optionally repeating steps (g) - (l) a sufficient number of times to
CC   generate a desired amount of double stranded nucleic acids and (n)
CC   determining the elongation product E and/or elongation product E' as a
CC   measure of the presence or amount of the analyte, where the lengths of
CC   the sequence I and the nucleobase sequence B are chosen such that, when
CC   the further primer hybridises to the elongation product E in step (g),
CC   the further primer spans a sequence formed by elongation of the
CC   hybridised primer of step (e) and overlaps at least a part of the 3'
CC   region of the hybridized primer of step (e) by an overlap length. The
CC   method is useful determining an analyte in a sample. In particular, the
CC   method is useful for generating multiple double stranded nucleic acids.
CC   The present sequence is a primer molecule used to exemplify the method of
CC   the invention

PT   Determining an analyte in a sample, for generating multiple double
PT   stranded nucleic acids, comprises employing a single primer sequence with
PT   a nucleobase sequence having affinity to the sequence contained in a
PT   target nucleic acid.
XX
PS   Example 1; Col 14; 25pp; English.
XX
CC   The invention relates to determining an analyte in a sample comprising
CC   (a) providing a target nucleic acid comprising a region A, a nucleobase
CC   sequence B, and a sequence I linked to the 5' terminus of the nucleobase
CC   sequence B, where the nucleobase sequence B is not specific for the
CC   analyte, and the region A specifically binds to the analyte, (b) binding
CC   the target nucleic acid to the analyte, separating the analyte bound to
CC   the target nucleic acid from the remaining part of the sample, (d)
CC   hybridising a primer to the target nucleic acid, where the primer
CC   comprises a nucleobase sequence B', and the nucleobase sequence B'
CC   hybridises to the nucleobase sequence B, (e) elongating the hybridised
CC   primer to produce an elongation product E using the target nucleic acid
CC   as a template and using nucleotides, where at least 30 % of the
CC   nucleotides contain at least one promiscuous base which is capable of
CC   base pairing with each of adenine, guanine, cytosine, and thymine, (f)
CC   separating the target nucleic acid from the elongation product E, (g)
CC   hybridising a further primer which comprises the nucleobase sequence B'
CC   to the elongation product E, where the elongation product E is capable of
CC   acting as a template for the elongation of the further primer, (h)
CC   elongating the hybridised further primer of step (g) to produce an
CC   elongation product E' using the elongation product E as a template and
CC   using nucleotides, where at least 30 % of the nucleotides contain at
CC   least one promiscuous base, (i) separating the elongation product E from
CC   the elongation product E', (j) hybridising a further primer comprising a
CC   nucleobase sequence B' to the target nucleic acid or the elongation
CC   product E, (k) elongating the further primer of step (j) to produce
CC   another elongation product E using the target nucleic acid or elongation
CC   product E as a template and using nucleotides, where at least 30 % of the
CC   nucleotides contain at least one promiscuous base, (l) separating product
CC   E of step (k) from the target nucleic acid or elongation product E, (m)
CC   optionally repeating steps (g) - (l) a sufficient number of times to
CC   generate a desired amount of double stranded nucleic acids and (n)
CC   determining the elongation product E and/or elongation product E' as a
CC   measure of the presence or amount of the analyte, where the lengths of
CC   the sequence I and the nucleobase sequence B are chosen such that, when
CC   the further primer hybridises to the elongation product E in step (g),
CC   the further primer spans a sequence formed by elongation of the
CC   hybridised primer of step (e) and overlaps at least a part of the 3'
CC   region of the hybridized primer of step (e) by an overlap length. The
CC   method is useful determining an analyte in a sample. In particular, the
CC   method is useful for generating multiple double stranded nucleic acids.
CC   The present sequence is a primer molecule used to exemplify the method of
CC   the invention

PT   Novel oligonucleotide label-domain for incorporation into oligonucleotide
PT   probes useful for detecting or localizing nucleic acid target genes
PT   within a cell or tissue sample.
XX
PS   Disclosure; Page 69; 71pp; English.
XX
CC   The present invention relates to a new oligonucleotide label-domain
CC   comprising the sequence (CTATTTT)_n and its complement (AAAATAG)_n, where
CC   n is 1. The probe sets of the invention are useful for detecting kappa or
CC   lambda-immunoglobulin light chain mRNA or corresponding heteronuclear
CC   RNA, CMV (cytomegalovirus) immediate early RNA, EBV (Epstein-Barr virus)
CC   early RNA 1 and RNA 2, and human Alu repetitive satellite genomic
CC   sequences. The invention is a useful generic sequence for incorporation
CC   into oligonucleotide probes for detecting gene-specific sequences within
CC   cells or tissue samples in in situ hybridisation analysis and for
CC   attaching a label to immunoglobulins or other proteins for detecting
CC   haptens and antigens in immunohistochemical analyses. The present nucleic
CC   acid sequence represents one of a collection (ABK70376-ABK70501) of
CC   oligonucleotide probes that were used in the invention for detecting or
CC   localising a plurality nucleic acid target gene or antigen within a cell
CC   or tissue sample

PT   Fluorescent dye or its salt, hydrate, solvate or stereoisomer for nucleic
PT   acid probe for measuring nucleic acid(s) containing specific nucleic acid
PT   sequence in sample, has specific formula.
XX
PS   Example 5; Page 33; 40pp; English.
XX
CC   The invention describes a novel fluorescent dye and method of detecting
CC   nucleic acid. The dye and method are useful for nucleic acid probes for
CC   measuring nucleic acid(s) containing a specific nucleic acid sequence in
CC   a sample, and for qualitative/quantitative assay of target RNA containing
CC   specific base sequence anticipated in gene mixture. The assay is useful
CC   in gene diagnosis and other areas of clinical diagnostics and in
CC   identification/quantification microorganisms in biological samples such
CC   as serum, plasma and urine, microbially contaminated samples from food,
CC   rooms, soil, rivers and sea. The fluorescent intercalative dye shows a
CC   large fluorescent enhancement upon intercalation into double-stranded
CC   nucleic acid, and shows a great difference between excitation and
CC   emission wavelengths (has a large Stokes shift) and does not have a
CC   fluorescent spectrum that overlaps with those of conventionally known
CC   fluorescent intercalation dyes. Viruses, microbial RNAs, specific
CC   sequences in one RNA, are detected or quantified in a short time, hence
CC   the detection method is applicable to clinical diagnosis which requires
CC   high reliability. Amplification and extraction efficiencies of the target
CC   nucleic acid, are checked. This sequence represents a synthetic DNA used
CC   as the target in an assay to detect double stranded DNA

PT   Detection of DNA polymorphism by mass spectroscopy for investigation and
PT   diagnosis of gene-related diseases.
XX
PS   Example 3; Page 28; 34pp; Japanese.
XX
CC   The present invention describes a method for detecting polymorphisms in
CC   DNA by: (a) preparing a DNA sample from patients containing the DNA
CC   region in which the target polymorphism is located; (b) hybridising to an
CC   appropriate oligonucleotide fragment, immobilised on a support; and (c)
CC   detecting the hybridised target DNA by mass spectroscopy. The method can
CC   be used for the investigation and diagnosis of gene-related diseases. The
CC   method allows polymorphisms to be detected rapidly and effectively in a
CC   large number of specimens. The present sequence represents an
CC   oligonucleotide which is used in an example from the present invention

PT   Assay of genetic sequences based on triplex formation from double
PT   stranded analyte - and hybrid of anchor and reporter sequences, with
PT   reporter released if triplex formation occurs, used e.g. to identify
PT   bacteria.
XX
PS   Disclosure; Col 13-14; 168pp; English.
XX
CC   The present sequence represents a potential triple-helix forming region.
CC   It can be used to demonstrate the assay of the invention. The assay
CC   comprises adding a sample containing double-stranded DNA test sequences,
CC   e.g. containing the present sequence, to an aqueous medium containing at
CC   least one complex of anchor DNA, attached to a solid support, and
CC   reporter DNA, where either a part of the anchor DNA or reporter DNA is
CC   designed to form a triple-strand structure with part of the test
CC   sequence. Triplex formation results in displacement of the reporter DNA
CC   which is detected as an indication of the presence of the DNA test
CC   sequence. The method is used to detect DNA sequences, particularly for
CC   identification of bacteria (by detecting genes for ribosomal RNA) in
CC   clinical samples, but also detection of oncogenes and Hepatitis B virus

PS   Claim 1; Page 323; 623pp; French.
XX
CC   The present invention relates to novel human nucleic acid sequences (I).
CC   The present sequence is one such nucleic acid sequence. Expression of (I)
CC   are implicated in tumour suppression or reversion and apoptosis and viral
CC   resistance. (I) are useful as probes or primers for detecting,
CC   identifying, measuring and/or amplifying nucleic acid sequences, as
CC   antisense reagents and for recombinant production of polypeptides. (I),
CC   polypeptides (II) encoded by (I), vector containing (I), cells containing
CC   these vectors and antibodies (Ab) against (II) are all useful for
CC   treatment/prevention of viral, tumour and cell degeneration diseases
CC   (especially neurodegeneration, such as Alzheimer's disease and
CC   schizophrenia). Analysing the expression of (I) is also useful for
CC   diagnosis and/or prognosis of such diseases. Transgenic animals carrying
CC   (I) are used for studying the aetiology of these diseases (also immune
CC   and inflammatory diseases). Note: In the present specification, SEQ ID 1
CC   to 2280 are claimed in Claim 1, however only SEQ ID 1 to 2270 are shown
CC   in the specification

CC   This invention describes a novel method for identifying compounds which
```

CC modulate the activity of a target biomolecule. The method uses 3-
CC dimensional representations of the biomolecule and a library of compounds
CC and comprises (a) identifying at least one molecular interaction site of
CC the target RNA; (b) generating in silico a virtual library of compounds
CC predicted or calculated to interact with the molecular interaction site;
CC and (c) comparing 3-dimensional (3-D) representations of the target RNA
CC with members of the virtual library of compounds to generate a hierarchy
CC of the compounds ranked in accordance with their respective ability to
CC form physical interactions with the molecular interaction site. The
CC method also describes (1) RNA comprising a joined sequence of at least 24
CC nucleotides but not more than 70 nucleotides and having secondary
CC structure defined by: (a) 3 nucleotides forming a first side of a first
CC double stranded (ds) region; (b) 2 nucleotides forming a first side of an
CC internal loop region; (c) 4 nucleotides forming a first side of a second
CC ds region; (d) 4 or 5 nucleotides forming an end loop region; (e) 4
CC nucleotides forming a second side of the second ds region; (f) 4
CC nucleotides forming a second side of the internal loop region; and (g) 3
CC nucleotides forming a second side of the first ds region; (2) a purified
CC and isolated RNA fragment comprising the human sequence
CC UUUACAACAUAAUCUAGUUUACAGAAAAAUC (II). The methods and products can be
CC used for identifying agents which modulate the activity of biomolecules,
CC particularly RNA. Such agents can be used as pharmaceutical, agricultural
CC or industrial compounds

PT Assay system for hepatitis C virus replicase activity comprises RNA
PT template with unstable, small stemloop capable of forming copy-back
PT structure, viral non-structural protein 5B, nucleoside triphosphates,
PT buffer.
XX
PS Example 1; Fig 1C; 10pp; English.
XX
CC The present invention relates to an assay system for hepatitis C virus

```
CC   (HCV) replicase activity. The assay system comprises an RNA template that
CC   has an unstable, small stemloop at the 3' end capable of forming a copy-
CC   back structure, a HCV non-structural protein 5B (NS5B), ATP, GTP, CTP,
CC   and UTP nucleoside triphosphates (NTPs), where one of the NTP is
CC   radiolabelled and an assay buffer that supports replication activity of
CC   NS5B. The invention also relates to the identification of optimal
CC   properties of an RNA template for copy-back self-priming RNA synthesis of
CC   HCV. This activity can be used to screen for anti-HCV replicase compounds
CC   or to characterise the biological relevance of lead compounds. The
CC   optimal RNA templates can be used for developing a system to characterise
CC   HCV NS5B polymerase mechanistically and kinetically and for designing
CC   small RNA molecules to co-crystallise with HCV NS5B polymerase. The assay
CC   system of the invention is useful for detecting HCV replicase activity.
CC   The nucleic acid synthesised by NS5B is detected by evaluating an
CC   autoradiograph of reaction products separated by gel electrophoresis. The
CC   present sequence is RNA template, (AU)4 used to direct RNA synthesis by
CC   RNA polymerase proteins of HCV, BVDV and polivirus. This sequence is used
CC   in the exemplification of the invention

PT   Judging the genotype of a region around a plant sd-1 gene with
PT   polymorphism-obtained markers isolated by positional cloning, useful in
PT   genotyping for examination of semi-dwarf character of rice.
XX
PS   Disclosure; Page 15; 104pp; Japanese.
XX
CC   The present invention describes a method for judging the genotype of a
CC   region around a plant semi-dwarf (sd-1) gene in which polymorphisms are
CC   present, by detecting the polymorphisms. Also described: (1) examining
CC   semi-dwarf characteristics of a plant using the judgment method with
CC   detection of polymorphisms; (2) oligonucleotides for amplifying sd-1 DNA
CC   regions, which are primers for judging the genotype of a region around a
CC   plant sd-1 gene; (3) reagents for judging the genotype of a region around
CC   a plant sd-1 gene containing these oligonucleotides; and (4) reagents for
CC   examining the semi-dwarf character of a plant containing the
CC   oligonucleotides. The method is for judging the genotype of a region
CC   around a plant sd-1 gene, which is applicable in genotyping by (d)CAPS
CC   ((derived) cleaved amplified polymorphic sequence) for examination of the
CC   semi-dwarf character of rice to identify desirable strains e.g. with high
CC   crop yield, pest resistance and resistance to flooded water. The method
CC   is easy and quick, in which a seedling is required for studying single
CC   nucleotide polymorphisms (SNPs) for genotyping, without needing
CC   cultivation of seedling to fully-grown plant for judging heterozygote and
CC   distinguishing morphology. The present sequence represents a rice sd-1
CC   DNA fragment, which is given in the exemplification of the present
```

```
CC   invention. Rice sd-1 is located on chromosome 1.

PT   Determining proliferative capacity of cells, useful e.g. for detecting
PT   tumor cells, by measuring concentration and subcellular localization of
PT   adenomatous polyposis coli protein.
XX
PS   Claim 10; Page 13; 26pp; German.
XX
CC   This invention describes a novel method for determining the proliferative
CC   activity of cells, comprising detecting, in a sample, the concentration
CC   and/or subcellular localization of APC (adenomatous polyposis coli)
CC   protein (I). The invention also describes (1) determining function of (I)
CC   in a sample by detecting presence of the C-terminal, DNA-binding domain
CC   of (I); (2) detecting mutations in (I)-encoding nucleic acid by detecting
CC   the DNA-binding domain of (I); (3) purifying, enriching and/or detecting
CC   (I) or its fragments by reaction with a probe; (4) double-stranded DNA
CC   (II) that contains the sequence GGCCGCA_2_3G (S1) and/or GATCCT_2_3GC
CC   (S2); (5) peptide fragment of (I) containing at least the DNA-binding
CC   domain; (6) antibodies (Ab) directed against an epitope of positions 1340
CC   -1901, 2219-2580 or 2581-2843 of (I); (7) set of two or more antibodies,
CC   one of which is Ab and the other directed against the N-terminal region
CC   (1-1299) of (I); and (8) kit for detecting DNA-binding capacity of (I) or
CC   its fragments in a sample consisting of (II), Ab or the set of (7). The
CC   method is used to detect proliferative, especially tumor (precursor),
CC   cells, to detect function of (I) and mutations in (I), and to purify
CC   and/or enrich (I), or its fragments, from a sample. The method allows
CC   simple, rapid and reliable detection of proliferation, without the need
CC   for polymerase chain reaction or sequencing

PT New human cytokine, designated zalpha11 ligand, useful for stimulating
PT the proliferation and/or development of hematopoietic cells in vitro and
PT in vivo, and for treating tumorigenesis.
XX
PS Example 6; Page 213; 256pp; English.
XX
CC The present PCR primer was used to amplify DNA encoding a fragment of
CC zeocin selective marker. The amplified fragment was used to construct a
CC vector for expression of zalpha11 ligand polypeptide. Zalpha11 ligand is
CC a cytokine. The zalpha11 ligand is useful for stimulating the
CC proliferation and development of haematopoietic cells in vitro and in
CC vivo. Zalpha11 ligand polynucleotides can be used as primers or probes
CC for cloning the zalpha11 gene. The zalpha11 ligand is useful for treating
CC tumourigenesis. A zalpha11 ligand-saporin fusion toxin may be used for
CC treating leukaemias and lymphomas. Antagonists against zalpha11 ligand
CC are useful as research reagents for characterizing ligand-receptor
CC interaction. Antagonists are also useful for inhibiting expansion,
CC proliferation, activation and differentiation of cells involved in
CC regulating hematopoiesis. The zalpha11 ligand may also be used to
CC stimulate an immune response against B cell tumour, a virus, a parasite
CC or a bacterium. The zalpha11 polypeptides, polynucleotides, antagonists,
CC agonists and antibodies are also useful for the detection, diagnosis,
CC prevention, and treatment of diseases associated with a zalpha11 ligand
CC genetic defect

PT New zalpha11 ligand polypeptides and polynucleotides, useful for
PT stimulating proliferation, activation, differentiation and/or induction
PT of inhibition of specialized cell function, or for stimulating an
PT antigenic response.
XX
PS Example 6; Col 135; 105pp; English.
XX
CC The present invention relates to the isolation of a novel cytokine,
CC zalpha11 Ligand and the polynucleotide encoding it. The invention also
CC gives the sequence for the zalpha11 receptor and the polynucleotide
CC encoding it. The zalpha11 Ligand polypeptide stimulates proliferation of
CC natural killer (NK) cells or NK cell progenitors, the activation of NK
CC cells, proliferation of T-cells, proliferation of B-cells stimulated with
CC anti-CD40 antibodies, stimulates an antigenic response in a mammal, and
CC reduces proliferation of B-cells stimulated with anti-IgM antibodies. The
CC zalpha11 Ligand polypeptide is also useful in preparing antibodies that
CC bind to zalpha11 Ligand epitopes. The zalpha11 Ligand polynucleotides can
CC be used as probes or primers to clone regions of a zalpha11 Ligand gene,
CC and in gene therapy. Zalpha11 Ligand may also be used to identify
CC inhibitors of its activity, to enhance the generation of anti-tumour
CC responses with or without the infusion of donor lymphocytes, and to
CC activate or stimulate the immune system. The present sequence represents
CC a primer used in the methods of the present invention

PT New zcytor17 ligand polypeptides, useful for treating inflammatory
PT diseases, such as inflammatory bowel disease, ulcerative colitis, Crohn's
PT disease, atopic dermatitis, eczema, psoriasis, endotoxemia, septicemia.
XX
PS Example 6; SEQ ID NO 30; 372pp; English.
XX
CC The invention relates to a novel isolated zcytor17 ligand polypeptide. A
CC polypeptide of the invention has antiinflammatory, dermatological,
CC immunosuppressive, and antimicrobial activity, and may have a use in a
CC vaccine. The polypeptide is useful for treating inflammatory diseases,
CC such as inflammatory bowel disease, ulcerative colitis, Crohn's disease,
CC atopic dermatitis, eczema, psoriasis, endotoxaemia, septicaemia, toxic
CC shock syndrome or infectious diseases. The present sequence is used in
CC the exemplification of the invention.

PT   Synthesizing RNA oligonucleotide involves combining single-stranded
PT   circular oligonucleotide, ribonucleotide triphosphate and polymerase
PT   enzyme to yield desired RNA complementary to circular oligonucleotide
PT   template.
XX
PS   Example 18; SEQ ID NO 38; 78pp; English.
XX
CC   The invention relates to a method for synthesising an RNA
CC   oligonucleotide, comprising combining a single-stranded circular
CC   oligonucleotide template with at least two types of ribonucleotide
CC   triphosphate and a polymerase enzyme to yield a single-stranded RNA
CC   oligonucleotide multimer complementary to the circular oligonucleotide
CC   template, where the RNA oligonucleotide multimer comprises multiple
CC   copies of the desired RNA oligonucleotide. The method is useful for
CC   synthesising an RNA oligonucleotide with well-defined ends. The circular
CC   oligonucleotide is introduced into the cell using direct injection,
CC   electroporation, calcium phosphate treatment, lipid-mediated delivery, or
CC   cation-mediated delivery. The method is useful for treating bacterial
CC   and/or viral infections in mammals, particularly drug resistant
CC   infections, and for producing double stranded DNA oligomers. The method
CC   is performed in the absence of an oligonucleotide primer, or without the
CC   addition of auxiliary proteins. This sequence represents an
CC   oligonucleotide used in the method of the invention.

PT   Analyzing repeat sequences in DNA using a probe which hybridizes to
PT   adjacent repetitive and non-repetitive regions and determining hybrid
PT   melting point is useful to detect microsatellite instability such as in
PT   hereditary cancer.
XX
PS   Claim 16; Page 7; 19pp; English.
XX
CC   The present invention relates to a method for analysing a target nucleic
CC   acid consisting of repetitive and non-repetitive sequences. The method
CC   comprises hybridising a polynucleotide probe comprising a segment
CC   complementary to a non-repetitive region and a segment complementary to
CC   an adjacent repetitive region, where the second segment consists of a
CC   defined number of repeats, and determining the melting point temperature
CC   of the hybrid. The method is used to analyse microsatellites, especially
CC   microsatellite instability, particularly as a means for detecting
CC   hereditary tumours. Alternatively, the method is used to identify an
CC   individual in a population. The present sequence is a probe for
CC   Mononucleotide repeat locus BAT26, and was used to illustrate the
CC   invention

PT   Detecting and separating nucleic acid, useful e.g. for diagnosis,
PT   comprises reaction with nanoparticles that carry oligonucleotides
PT   complementary to parts of the target.
XX
PS   Example 24; Fig 44; 404pp; English.
XX
CC   The invention relates to a method for detection of nucleic acid (I)
CC   having at least 2 portions, comprising treatment with nanoparticles that
CC   carry oligonucleotides complementary to at least 2 parts of (I), where
CC   detectable change caused by hybridisation of the oligonucleotide to (I)
CC   is observed. The method is used to detect (or to separate) specific (I),
CC   e.g. for diagnosing a wide variety of diseases, sequencing, in forensic
CC   analysis etc., and generally to detect analytes other than (I). The
CC   oligonucleotide-derivatised nanoparticles are also useful for preparing
CC   nanostructures useful, for example, as biochips, biofilters, mechanical
CC   devices, separation membranes, chemical sensors, in computers, and for
CC   drug delivery. Very stable nanoparticle-oligonucleotide conjugates can be
CC   produced, allowing their direct use (as probes) in polymerase chain
CC   reaction, i.e. they survive multiple heating/cooling cycles so do not
CC   need to be added after amplification. (I) are detected by simple colour
CC   change, without the need for special equipment, making possible rapid
CC   field testing for e.g. pathogens. AAS63374-AAS63448 represent
CC   oligonucleotide-nanoparticle probes, and related sequences, used in the
CC   method of the invention

PT Detecting a nucleic acid useful in e.g. diagnosing genetic, bacterial or
PT viral diseases, by contacting the nucleic acid with oligonucleotides
PT attached to nanoparticles and having sequences complementary a portion of
PT the nucleic acid.
XX
PS Example 24; Fig 44; 323pp; English.
XX
CC The sequence represents a cyclic disulphide linked oligonucleotide which
CC may be coupled with colloidal gold particles (nanoparticles) and used to
CC demonstrate the method of the invention. The invention relates to
CC isolating or detecting a nucleic acid of interest, in a mixture of
CC nucleic acids, by binding it to 2 or more complimentary nucleotides which
CC have a nanoparticle attached to their 5' ends. The nanoparticles (e.g.
CC colloidal gold) are used to both isolate and detect (e.g. by linking the
CC particle to a fluorescent probe) the resultant complex. The methods are
CC useful for detecting nucleic acids, natural or synthetic, and modified or
CC unmodified. The methods may also be applied in the diagnosis of genetic,
CC bacterial and viral diseases, in forensics, in DNA sequencing, for
CC paternity testing, for cell line authentication, and for monitoring gene
CC therapy. The methods are further useful in research and analytical
CC laboratories in DNA sequencing, in the field to detect the presence of
CC specific pathogens, for quick identification of an infection to assist in
CC drug prescription, and in homes and health centres for inexpensive first-
CC line screening. The methods, which are based on observing colour change
CC with the naked eye, are cheap, fast, simple, robust (reagents are
CC stable), do not require specialised or expensive equipment, and little or
CC no instrumentation is required

PT Detecting nucleic acid, useful for diagnosis of genetic, viral or
PT bacterial disease, comprises hybridizing nanoparticles with attached
PT oligonucleotides to nucleic acid and detecting change brought about by
PT hybridization.
XX
PS Example 24; Fig 44; 412pp; English.
XX
CC The invention relates to a method of detecting a nucleic acid (NA) having
CC at least 2 portions comprising: (a) providing nanoparticles (NP) with
CC attached oligonucleotides (OGN), where OGN has a sequence complementary
CC to the sequence of NA; (b) contacting NA and NP under conditions
CC effective to allow hybridisation of OGN with NA; and (c) observing a
CC detectable change brought about by hybridisation of OGN with NA. The
CC method is useful for detecting a nucleic acid, separating a selected
CC nucleic acid from others and methods of nanofabrication. Detecting
CC analytes such as nucleic acids and proteins are useful for the diagnosis
CC of genetic, bacterial and viral diseases. The OGN-NP conjugates that use
CC cyclic disulphide linkers improve the sensitivity of diagnostic assays.
CC In particular assays using OGN-NP conjugates prepared using linkers
CC comprising a steroid residue attached to a cyclic disulphide have been
CC found to be approximately 10 times more sensitive than assays employing
CC conjugates prepared using alkanethiols or acyclic disulphides as the
CC linker. The OGN-NP conjugates are stable allowing them to be used
CC directly in PCR solutions. Therefore conjugates added as probes to a DNA
CC target to be PCR amplified can be carried through the 30 or 40 heating
CC cooling cycles of the PCR and are still able to detect the amplicons
CC without opening the tubes and causing contamination. ABK64981-ABK65055

PT   Detecting nucleic acid having two portions, by providing nanoparticles
PT   having oligonucleotides attached to it, contacting nucleic acid and
PT   nanoparticles to allow hybridization, and observing detectable change.
XX
PS   Example 24; Fig 44; 442pp; English.
XX
CC   The invention describes a method of detecting (M1) a nucleic acid having
CC   two portions, involving providing nanoparticles having oligonucleotides
CC   attached to it, which has a sequence complementary to sequence of two
CC   portions of nucleic acid, contacting nucleic acid and nanoparticles, to
CC   allow hybridisation of oligonucleotides with two or more portions of
CC   nucleic acid, and observing a detectable change brought about by
CC   hybridisation. (M1), nanoparticles (I), nanoparticle-oligonucleotide
CC   conjugates (II) and the aggregate probe are useful for detecting two or
CC   more nucleic acids (from a biological source) having at least two
CC   portions, such as viral RNA, bacterial or fungal DNA, a gene associated
CC   with a disease, synthetic, or structurally-modified natural or synthetic
CC   RNA or DNA, or a product of a polymerase chain reaction amplification.
CC   (II) is useful for preparing a nanoprobe conjugate for detecting an
CC   analyte, and for detecting a nucleic acid bound to an electrode surface.
CC   (I) and (II) are useful for fabrication, and for separating a selected
CC   nucleic acid having two portions from other nucleic acids. (I), (II) and
CC   the aggregate probe are useful for detecting an analyte (especially
CC   polyvalent analyte) in a sample. This sequence represents a
CC   polynucleotide used to demonstrate the method of the invention

PT   Detecting nucleic acid having two portions, by providing nanoparticles
PT   having oligonucleotides attached to it, contacting nucleic acid and
PT   nanoparticles to allow hybridization, and observing detectable change.
XX
PS   Example 24; Fig 44; 467pp; English.
XX
CC   The invention relates to a method of detecting a nucleic acid having two
CC   portions. The method involves providing nanoparticles having
CC   oligonucleotides attached to it which has a sequence complementary to
CC   sequence of two portions of nucleic acid, contacting nucleic acid and
CC   nanoparticles to allow hybridisation of oligonucleotides with two or more
CC   portions of nucleic acid and observing a detectable change brought about
CC   by hybridisation. The method and aggregate probes are useful for
CC   detecting two or more nucleic acids (from a biological source) having at
CC   least two portions such as viral RNA, bacterial or fungal DNA, a gene
CC   associated with a disease, synthetic or structurally modified natural or
CC   synthetic RNA or DNA, or a product of a polymerase chain reaction
CC   amplification. The invention is useful for preparing a nanoprobe
CC   conjugate for detecting an analyte and for detecting a nucleic acid bound
CC   to an electrode surface. It is also useful for fabrication and for
CC   separating a selected nucleic acid having two portions from other nucleic
CC   acids. The present sequence is an oligo used to illustrate the method of
CC   the invention

PT Producing protein or DNA libraries which are useful for improving
PT existing proteins, by in vitro translating protein coding sequences to
PT produce RNA-protein fusions and incubating these protein fusions under
PT high salt conditions.
XX
PS Disclosure; Page 44; 121pp; English.
XX
CC The present sequence is one of a number of oligonucleotides which were
CC used for the generation of RNA-protein fusions, including fusions having
CC a myc epitope tag. The RNA-protein fusions comprise a protein covalently
CC linked to the 3' end of its own mRNA. This is accomplished by synthesis
CC and in vitro or in situ translation of an mRNA molecule with a peptide
CC acceptor attached to its 3' end. The RNA-protein fusions are incubated
CC under high salt conditions to produce a protein library. This method is
CC useful for improving or altering existing proteins, as well as for
CC isolating new proteins and nucleic acid or small molecule targets. It may
CC also be used to improve human or humanised single-chain antibodies for
CC the treatment of a number of diseases. The method is useful for the
CC isolation of proteins with specific binding properties, for screening
CC cDNA libraries and cloning new genes on the basis of protein-protein
CC interactions. Unlike prior art, the new method does not rely on
CC maintaining the integrity of an mRNA:ribosome:nascent chain ternary
CC complex, which is very fragile and is therefore of limited use. The
CC method does not rely on topological links between the protein and the
CC nucleic acid so that the information of the protein is retained and can
CC be recovered in readable, nucleic acid form

PT Novel replicase complex comprising hepatitis C virus NS5B replicase, a 3
PT nucleotide-long template to which a 2 nucleotide-long primer is annealed,
PT and template and primer which do not form a stable duplex in the absence
PT of HCV NS5B.
XX
PS Example; Page 6; 17pp; English.
XX
CC The invention relates to a replicase complex comprising a hepatitis C
CC virus (HCV) NS5B replicase protein, a linear nucleic acid template and a
CC complementary nucleic acid primer which is annealed to the 3' terminus of
CC the template, where the template is at least three nucleotides and the
CC primer is two or three nucleotides, and the template and primer do not
CC form a stable duplex in solution in the absence of the HCV NS5B protein.
CC The complex is useful for detecting HCV replicase activity and permits
CC establishment of sensitive RNA-dependent RNA polymerase assays to screen
CC and evaluate antiviral inhibitors and to improve the specificity and
CC efficacy of the inhibitors. The complex is also useful in the development
CC of a reliable system for determining kinetic and thermodynamic constants
CC of HCV NS5B-catalysed nucleotide incorporation and investigation of
CC mechanistic inhibitors for mis-incorporation or chain termination.
CC Specifically, the short RNA template and primer pairs are useful in
CC screening assays which are used for determining kinetic, thermodynamic
CC and mechanistic properties of NS5B replication and ultimately in the
CC development of inhibitors of NS5B. Newly identified inhibitors of
CC replicase activity may be used for developing anti-HCV pharmaceuticals.
CC Sequences ABK99271-ABK99296 represent HCV NS5B replicase RNA synthesis

PT Assay system for hepatitis C virus replicase activity comprises RNA
PT template with unstable, small stemloop capable of forming copy-back
PT structure, viral non-structural protein 5B, nucleoside triphosphates,
PT buffer.
XX
PS Example 1; Fig 1A; 10pp; English.
XX
CC The present invention relates to an assay system for hepatitis C virus
CC (HCV) replicase activity. The assay system comprises an RNA template that
CC has an unstable, small stemloop at the 3' end capable of forming a copy-
CC back structure, a HCV non-structural protein 5B (NS5B), ATP, GTP, CTP,
CC and UTP nucleoside triphosphates (NTPs), where one of the NTP is
CC radiolabelled and an assay buffer that supports replication activity of
CC NS5B. The invention also relates to the identification of optimal
CC properties of an RNA template for copy-back self-priming RNA synthesis of
CC HCV. This activity can be used to screen for anti-HCV replicase compounds
CC or to characterise the biological relevance of lead compounds. The
CC optimal RNA templates can be used for developing a system to characterise
CC HCV NS5B polymerase mechanistically and kinetically and for designing
CC small RNA molecules to co-crystallise with HCV NS5B polymerase. The assay
CC system of the invention is useful for detecting HCV replicase activity.
CC The nucleic acid synthesised by NS5B is detected by evaluating an
CC autoradiograph of reaction products separated by gel electrophoresis. The
CC present sequence is RNA template, (AU)5 used to direct RNA synthesis by
CC RNA polymerase proteins of HCV, BVDV and polivirus. This sequence is used
CC in the exemplification of the invention

PT   Depositing nucleic acid on substrate by direct-write nanolithography, by
PT   positioning nanoscopic tip relative to substrate, to transfer nucleic
PT   acid to substrate and generate stable nucleic acid nanoscale pattern.
XX
PS   Disclosure; Page 38; 76pp; English.
XX
CC   The invention relates to a method of depositing nucleic acid onto a
CC   substrate by direct-write nanolithography, by positioning at least one
CC   nanoscopic tip relative to a substrate so that the tip and substrate
CC   approach each other, and the nucleic acid is transferred from the tip to
CC   the substrate to generate a stable nucleic acid nanoscale pattern on the
CC   substrate which is hybridizable with complementary nucleic acid. The
CC   method is useful for generating nanoscale patterns of nucleic acid on a
CC   substrate, in which before transfer the tip is modified to allow the
CC   nucleic acid to wet the tip and the nucleic acid is modified to chemisorb
CC   or covalently bond to the substrate upon transfer. The method is also
CC   useful for direct patterning of modified nucleic acid onto a substrate,
CC   by inking a scanning probe microscopic tip with a modified nucleic acid
CC   and positioning the inked tip close enough to the substrate to effect
CC   transfer of the nucleic acid to the substrate to form a nanoscale
CC   pattern. Another use for the method is for assembling nanoparticles (e.g.
CC   gold nanoparticles) to form nanoscale patterns, by depositing from a
CC   nanoscopic tip a first nucleic acid onto a substrate to form a deposit
CC   with lateral nanoscale features of 1000 mm or less by direct write
CC   nanolithography, hybridizing the nucleic acid deposit with the
CC   nanoparticle, where the nanoparticle is functionalized with a second
CC   nucleic acid which is either complementary to the first or complementary
CC   to the nucleic acid of a linking strand which links the second nucleic
CC   acid to the first. Deposition of nucleic acid on the substrate is
CC   repeated to form a nanoarray of the nucleic acid and the hybridization is
CC   carried out with the nanoarray. The method is suitable for writing
CC   preconceived nanoscale features directly, without use of expensive and
CC   potentially destructive methods such as electron beam and
CC   photolithographic methods. The structures can be built up, if desired,
CC   without degrading existing structures. Complicated stamps and resists are
CC   not needed. Improvements in the consistency and stability of the
CC   nanolithography can be observed. This sequence represents an example of a
CC   nucleic acid that can be used in the method of the invention.

PT   New oligomers contg. modified bases - which form a triplex with G-C
PT   doublet in a DNA duplex, for treating and diagnosing HIV, hepatitis,
PT   herpes malignancy and inflammation.
XX
PS   Claim 12; Page 71; 77pp; English.
XX
CC   The synthetic oligomer is capable of forming a triplex at physiological
CC   pH with a purine rich target sequence by coupling into the major groove
CC   of the duplex. The specific target sequence of this oligomer is the human
CC   interleukin 6 gene untranslated sequence contg. a purine rich sequence
CC   concd. on one strand of the duplex. The oligomer, and others like it are
CC   useful in diagnosis and therapy of diseases characterised by specific DNA
CC   duplex targets, e.g. HPV, HER, HIV, hepatitis B, herpes, malignant
CC   tumours and inflammation. The triple helices form under mild conditions
CC   thus assays may be carried out without subjecting the test specimen to
CC   harsh conditions. The oligomer contains an inverted polarity region
CC   formed from an o-xyloso dimer synthon. The linking gp. is o-xyloso
CC   (nucleotides have the 3'positions of xylose sugars linked via the o-
CC   xylene ring). Two nucleotides are coupled through a xylene residue to
CC   form the dimer synthon. This additional modifications may render the
CC   oligomer stable to nuclease activity. The oligomer is able to inhibit
CC   gene expression, as verified by in vitro systems. See also AAQ25452-25501
CC   and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN field.)

PT   Identifying lung cancer/metastasis of solid tumor in patient by isolating
PT   blood or non-lung tissue, or bone marrow from patient and identifying
PT   presence of marker e.g. syndecan 1, collagen 1 alpha 2, 7013, or 7018.
XX
PS   Example 1; Page 6; 29pp; English.
XX
CC   The sequences given in AAI72265-69 are oligonucleotides which were used
CC   in the method of the invention for identifying lung cancer or metastasis
CC   of a solid tumour. The method comprises isolating blood (or non-lung
CC   tissue in the case of identifying lung cancer, or bone marrow in case of
CC   identifying metastasis) from a patient, and identifying the presence of
CC   at least one marker (M) such as syndecan 1, collagen 1 alpha 2, 7013, or
CC   7018. These oligos lead to the amplification of cDNA's which were more
CC   abundant in lung cancer RNA than in normal blood. The method is useful
CC   for identifying lung cancer in a mammal e.g., human, dog or cat, and
CC   identifying metastasis of solid tumour in a patient, where the solid
CC   tumour is of bile duct, colon, breast, uterus, oesophagus or larynx. The
CC   method is useful for identifying presence of lung cancer cells in the
CC   blood or bone marrow, and also for identifying metastasis and thus for
CC   identifying lung cancer cells in an organ such as liver or brain. The
CC   method is useful to identify the presence of lung cancer cells at a very
CC   early stage in the disease, or after remission or to identify a relapse

PT   Preparation of normalised, subdivided cDNA libraries from mRNA - by
PT   reverse transcription and amplification, used to screen for new genes and
PT   interacting proteins, potential drugs, and for diagnosis.
XX
PS   Example 1; Page 29; 71pp; English.
XX
CC   The invention relates to preparation of a normalised, subdivided library
CC   of amplified cDNA from the coding regions of mRNA in a sample. The method
CC   involves reverse transcription, with at least one cDNA primer of formula
CC   5'-Con1-dTn2-Vn3-Nn4 to form first stand cDNA where Con1 = any sequence
CC   of 1-100 nucleotides; dT = deoxythymidinyl; n2 is at least 1; n3 and n4
CC   are both 0, or n3 is 1 and n4 is at least 1; followed by second strand
CC   cDNA synthesis using the first strand as template and a second cDNA
CC   primer of a similar formula, in the presence of DNA polymerase I (or its
CC   Klenow fragment) and amplification of double-stranded cDNA with a set of
CC   amplification primers. Comparison of cDNA in the prepared library with a
CC   database (a computer-generated list of molecular weights of restricted
CC   DNA fragments of known sequence) is used to determine presence of an
CC   expressed protein in a cell, also to detect changes in such expression
CC   (particularly for diagnosis of disease). Surfaces (chip) having amplified
CC   cDNA stably immobilised on it, obtained by a similar method, are used to
CC   screen for genes of a particular family, by hybridisation with nucleic
CC   acid from the family (to identify new genes) and to detect differences in
CC   expression patterns between cells. The polypeptides expressed by the
CC   libraries can be used for drug development. Sequences AAV71935 to
CC   AAV71946 represent primers used to exemplify the method of the invention

PT Inserting a nucleic acid into a circular vector comprising joining their
PT ends, melting, and reannealing ends at two different concentrations,
PT useful for cloning small amounts of nucleic acids and forming genomic
PT libraries.
XX
PS Example 4; Page 68; 71pp; English.
XX
CC This invention describes a novel method (M1) for inserting a nucleic acid
CC (N1) into a circular vector (V1) comprising joining ends of N1 and V1
CC under a first nucleic acid concentration, melting hybridized cohesive
CC circularization ends, and reannealing the ends at a second concentration.
CC The methods are useful for the cloning small amounts of nucleic acids and
CC forming genomic libraries of complex populations of DNA or cDNA. The
CC methods allow the cloning of minute amounts of nucleic acids efficiently
CC and avoids the size selection problems of prior art systems. Larger
CC nucleic acid fragments are just as easily cloned, allowing highly
CC representative libraries to be made. Vector to vector ligation is avoided
CC using the methods. AAA40351-A40366 represents primers used to illustrate
CC the method of the invention

PT New normalised directional cDNA libraries - used for isolating novel
PT cDNA's, including tissue-specific and development-specific DNA.
XX
PS Disclosure; Page 45; 186pp; English.
XX
CC Human tissues were obtained for construction of a variety of cDNA
CC libraries, including infant brain, adult brain and adult hippocampus.
CC Each of the cDNA libraries had a characteristic sequence identifier,
CC provided by the oligonucleotide utilised to prime first strand cDNA
CC synthesis (see AAQ87894-Q87907 for these primer sequences; all these
CC primers have the PacI restriction site for directional cloning of cDNAs).
CC Each of the libraries was propagated in the form of single-stranded (ss)
CC circles and normalised separately by a novel method. The method
CC comprises: generating fragments complementary to the 3' non-coding
CC sequence of the ss circles in the library to produce partial duplexes;
CC purifying the partial duplexes; melting and reassociating them to
CC appropriate Cot; and purifying the unassociated ss circles to generate a
CC normalised cDNA library. (Updated on 25-MAR-2003 to correct PN field.)

PT   New phospho:di:esteric oligo:nucleotide(s) - which exert a specific and
PT   selective cytotoxic effect on tumour cells, for treating both solid and
PT   liquid tumours.
XX
PS   Claim 10; Page 5; 38pp; English.
XX
CC   Novel phosphodiesteric oligonucleotides AAT93811-27 are based on the
CC   generic formula, in the 3'-5' or 5'-3' direction: (GaTa')a''-(GbTb')b''-
CC   (GcTc')c''-(GdTd')d''-(GeTe')e''-(GfTf')f''- (G-gTg')g''-N', where: N and
CC   N' = T or G, equal or different from each other; x = 0-8, equal or
CC   different from each other; a, b, c, d, e, f, and g = 0-10, equal or
CC   different from each other; a', b', c', d', e', f', and g' = 0-30, equal
CC   or different from each other; a'', b'', c'', d'', e'', f'', and g'' = 1-
CC   16, equal or different from each other; The oligonucleotides are believed
CC   to selectively bind and sequester some proteins which are essential to
CC   the viability and growth of tumoural cell line. They have specific and
CC   selective cytotoxic activity against tumour cells, and can be used for
CC   treating tumours of the liquid type, in particular of lymphoblastic
CC   origin, and of solid type, in particular lymphomas. The present
CC   phosphodiester oligonucleotide, at a concentration of 15 micromolar,
CC   reduced growth of CCRF-CEM tumoural cells by 83%, which is detectable 48
CC   hours after administration. (Updated on 25-MAR-2003 to correct PR field.)

PT   Identifying a candidate polymorphic repeat within a coding sequence, for
PT   understanding or treating genetic disease, comprises detecting tandem
PT   repeats in a target coding sequence and scoring the repeats for
PT   polymorphic probability.
XX
PS   Example; Col 717; 588pp; English.
XX
CC   The invention discloses a method for identifying a candidate polymorphic
CC   repeat within a coding sequence (expressed sequence tag, EST), which
CC   comprises detecting tandem repeats in a target coding sequence, scoring
CC   the repeats for polymorphic probability and generating a dataset
CC   correlating the repeats with polymorphic probability to identify a
CC   candidate polymorphic repeat. The computational methods (polymorphic
CC   marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are
CC   useful for identifying and detecting candidate polymorphic repeats in
CC   human genes, which can be used to understand, treat or eliminate genetic
CC   diseases, predispositions or adverse drug-treatment reactions. Examples
CC   of diseases linked to nucleotide repeats are Machado-Joseph, Haw River
CC   syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis,
CC   myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and
CC   spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are
CC   the polymorphic repeats identified for a search of human ESTs

XX
PT   New enzymatic RNA molecules (ribozymes) - which cleave mRNA associated
PT   with tumours or mRNA expressed from gene encoding multiple drug
PT   resistance.
XX
PS   Claim 3; Fig 8; 69pp; English.
XX
CC   The sequences given in AAQ51825-2266 represent areas of mRNAs which are
CC   associated with development or maintenance of chronic myelogenous
CC   leukemia (CML), promyelocytic leukemia, Burkitt's lymphoma, or acute
CC   lymphocytic leukemia, follicular lymphoma, B-cell acute lymphocytic
CC   leukemia, breast cancer, colon carcinoma, neuroblastoma and lung cancer.
CC   The full length mRNAs containing these target sequences, encode aberant
CC   cellular proteins which are able to control cellular proliferation and
CC   are directly linked to a leukemic phenotype. These target sequences are
CC   identified by the ribozyme of the invention. The ribozymes is formed in a
CC   hammerhead motif, but may also be formed in the motif of a hairpin,
CC   hepatitis delta virus, group I intron or RNaseP-like RNA. These ribozymes
CC   may be used to inhibit the development or expression of a transformed
CC   phenotype in man and other animals by modulating expression of the
CC   corresponding gene. Cleavage of target mRNAs expressed in pre-neoplastic
CC   and transformed cells elicits inhibition of the transformed state.
CC   Multiple drug resistance (mdr-1) mRNA specific ribozymes remove the
CC   mechanism of drug resistance used by transformed cells and thus enhances
CC   drug therapies for tumours. The ribozymes may also be used to study
CC   genetic drift and mutations within cells. (Updated on 25-MAR-2003 to
CC   correct PN field.)

XX
PS   Disclosure; Page 57; 442pp; English.
XX
CC   The invention describes a method of detecting (M1) a nucleic acid having
CC   two portions, involving providing nanoparticles having oligonucleotides
CC   attached to it, which has a sequence complementary to sequence of two
CC   portions of nucleic acid, contacting nucleic acid and nanoparticles, to
CC   allow hybridisation of oligonucleotides with two or more portions of
CC   nucleic acid, and observing a detectable change brought about by
CC   hybridisation. (M1), nanoparticles (I), nanoparticle-oligonucleotide
CC   conjugates (II) and the aggregate probe are useful for detecting two or
CC   more nucleic acids (from a biological source) having at least two
CC   portions, such as viral RNA, bacterial or fungal DNA, a gene associated
CC   with a disease, synthetic, or structurally-modified natural or synthetic
CC   RNA or DNA, or a product of a polymerase chain reaction amplification.
CC   (II) is useful for preparing a nanoprobe conjugate for detecting an
CC   analyte, and for detecting a nucleic acid bound to an electrode surface.
CC   (I) and (II) are useful for fabrication, and for separating a selected
CC   nucleic acid having two portions from other nucleic acids. (I), (II) and
CC   the aggregate probe are useful for detecting an analyte (especially
CC   polyvalent analyte) in a sample. This sequence represents a
CC   polynucleotide used to demonstrate the method of the invention

PT   Detecting target polynucleotide in a sample, by amplifying target,
PT   hybridizing it to oligonucleotides bound to nanoparticles in nanoparticle
PT   detection system, and determining amount of signal generated due to
PT   binding.
XX
PS   Example 1; Page 35; 74pp; English.
XX
CC   The sequences given in ABQ80394-99 represent probes and targets which
CC   were used in the method of the invention for detecting a target
CC   polynucleotide in a sample. The method comprises amplifying the target,
CC   hybridizing the target to oligonucleotides bound to nanoparticles in a
CC   nanoparticle detection system, determining the amount of signal generated
CC   as a result of binding, optionally repeating the above steps, and
CC   detecting the presence of the target oligonucleotide by analysing for the
CC   amount of signal produced after at least one amplification cycle. The
CC   method is useful for detecting target polynucleotide in a sample, and for
CC   determining the quantity of target polynucleotide in a sample. The method
CC   is useful in research and analytical laboratories in DNA sequencing, in
CC   the field to detect the presence of specific pathogens, in the doctor's
CC   office for quick identification of an infection to assist in prescribing
CC   a drug for treatment, and in homes and health centres for inexpensive
CC   first-line screening. The method is based on observing colour change with
CC   the naked eye, hence the method is cheap, fast, simple, robust, do not
CC   require specialized or expensive equipment, and little or no
CC   instrumentation is required

PT   Producing protein or DNA libraries which are useful for improving
PT   existing proteins, by in vitro translating protein coding sequences to
PT   produce RNA-protein fusions and incubating these protein fusions under
PT   high salt conditions.
XX
PS   Disclosure; Page 43; 121pp; English.
XX
CC   The present sequence is one of a number of oligonucleotides which were
CC   used for the generation of RNA-protein fusions, including fusions having
CC   a myc epitope tag. The RNA-protein fusions comprise a protein covalently
CC   linked to the 3' end of its own mRNA. This is accomplished by synthesis
CC   and in vitro or in situ translation of an mRNA molecule with a peptide
CC   acceptor attached to its 3' end. The RNA-protein fusions are incubated
CC   under high salt conditions to produce a protein library. This method is
CC   useful for improving or altering existing proteins, as well as for
CC   isolating new proteins and nucleic acid or small molecule targets. It may
CC   also be used to improve human or humanised single-chain antibodies for
CC   the treatment of a number of diseases. The method is useful for the
CC   isolation of proteins with specific binding properties, for screening
CC   cDNA libraries and cloning new genes on the basis of protein-protein
CC   interactions. Unlike prior art, the new method does not rely on
CC   maintaining the integrity of an mRNA:ribosome:nascent chain ternary
CC   complex, which is very fragile and is therefore of limited use. The
CC   method does not rely on topological links between the protein and the
CC   nucleic acid so that the information of the protein is retained and can
CC   be recovered in readable, nucleic acid form

PT   Encoding and sorting in vitro translated proteins, useful for the
PT   identification of desired binding partners, comprises attaching a nucleic
PT   acid linker to the protein and binding an encoding molecule to the
PT   linker.
XX
PS   Example 3; Fig 9B; 48pp; English.
XX
CC   The sequence represents part of a branched encoding molecule used in
CC   methods to hybridise a capture probe to the addressing element of a DNA
CC   linker attached to an in vitro translated protein, in order to immobilise
CC   the protein to a solid support. The new methods are useful for tagging or
CC   encoding in vitro translated proteins with unique and minimal encoding
CC   molecules and sorting these molecules onto solid supports. They are also
CC   useful for the identification of a desired binding partner. The method
CC   allows the use of pre-made sets of universal encoding molecules, such as
CC   nucleic acid(s) (analogues). These can be used in conjunction with
CC   corresponding universal microarrays or sets of microparticles to create
CC   new protein display systems which are flexible, modular, scalable and
CC   cost effective. The method allows the use of nucleic acid analogue which
CC   are not susceptible to enzymatic incorporation or polymerisation and are
CC   superior to conventional DNA/RNA. The proteins can also be labelled with
CC   fluorescent groups which can be used to monitor the protein in real time.
CC   The absence of RNA is advantageous as they can adopt secondary structures
CC   which are difficult to predict and can interfere with hybridisation steps
CC   and protein folding/function

PT   System for detecting immobilized analyte, useful e.g. for biomedical
PT   diagnosis, has as detection agent specific polypeptide coupled to nucleic
PT   acid for signal amplification.
XX
PS   Example; Page 6; 12pp; German.
XX
CC   This invention describes a novel test system (A) which comprises at least
CC   one immobilized analyte (I) on an insoluble carrier and a polypeptide
CC   detection agent (II), specific for (I) and conjugated, via a linker, to
CC   an amplifier (III). (A) is used for direct, in vitro detection of (I)
CC   with amplification of the signal by polymerase chain reaction (PCR), or a
CC   related technique, applied to (III). The method is useful in biomedical
CC   diagnosis and environmental monitoring and can be used to detect a wide
CC   range of (I), e.g. diagnostic or pharmaceutical agents, secondary
CC   metabolites, herbicides or pesticides. (A) allow simultaneous, parallel
CC   detection of many different analytes (high throughput capacity),
CC   relatively simply (only a few incubation and washing steps are required)
CC   and with high sensitivity and selectivity. This sequence represents
CC   primer used in the ampification of the c-myc DNA fragment which encodes
CC   an epitope used to illustrate the method of the invention

PT   Detecting and purifying biological material by (di)electrophoresis,
PT   useful e.g. for separating tissues and viruses, comprises using a probe
PT   that alters (di)electrophoretic properties.
XX
PS   Example 1; Page 12; 20pp; German.
XX
CC   The present invention relates to a method for the detection or
CC   purification of biological material by electrophoresis, which comprises
CC   (i) treating the biological material containing different species with a
CC   bioprobe and (ii) establishing an electric field for detection or
CC   purification of at least one complex formed between the biological
CC   material being tested and a specifically bound bioprobe. The method is
CC   used for detection and purification of tissue, cells, cell organelles,
CC   viruses, proteins, nucleic acids, lipids and/or other organic compounds.
CC   It can also be used for the isolation of specific bioprobes from a
CC   library of bioprobes. The present sequence is a linker described in the
CC   exemplification of the invention

PT   Selection of specific protein by screening protein-RNA fusions generated
PT   in vitro or in situ - useful for, e.g. identifying enzymes and antibodies
PT   with altered properties, potentially useful as catalysts or for therapy
PT   or diagnosis.
XX
PS   Disclosure; Page 39; 94pp; English.
XX
CC   The Oligonucleotides AAV48087, AAV48089-V48091 and AAV48096-V48098 and
CC   variations were used to generate RNA-protein fusions. These were used in
CC   the selection of a specific protein or RNA, by in vitro or in situ
CC   translation of candidate RNA molecules to produce RNA-protein fusions,
CC   then selecting specific RNA protein fusions. The method is used to select
CC   proteins (or DNA encoding them) having altered properties, e.g. for
CC   identification of new binding reagents, to identify improved human
CC   antibodies or new enzymes. These proteins are potentially useful in
CC   diagnosis and therapy, or as industrial catalysts. The methods allow many
CC   rounds of selection and amplification to be performed, resulting in
CC   enrichment of even very rare molecules and allowing isolation of proteins
CC   that bind specifically to almost any compound or catalyse almost any
CC   reaction

PT   New immunostimulatory compositions comprising RNA/DNA hybrid
PT   oligonucleotides, useful for enhancing an immune response or inducing
PT   cytokines, particularly for treating diseases, e.g. cancer, allergy or
PT   HIV infection.
XX
```

PS Example 1; Page 30; 68pp; English.
XX
CC The present invention relates to an immunostimulatory composition, which
CC comprises at least one oligonucleotide comprising both an RNA region and
CC a DNA region. The composition is useful for enhancing an immune response
CC or inducing cytokines. It can be used as a vaccine adjuvant and in
CC treating diseases, including pathogenic infection, (non-)malignant
CC tumours (e.g. cancers of the brain, lung, ovary, breast, prostate or
CC colon, or carcinomas and sarcomas), autoimmune diseases or allergies
CC (e.g. allergic rhinitis, hay fever or food allergies), Lyme disease,
CC hepatitis, HIV or malaria. The composition is also useful for treating,
CC preventing or ameliorating the symptoms resulting from exposure to a bio-
CC warfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is
CC an immunostimulatory oligonucleotide described in the exemplification of
CC the invention

PT Identifying and characterizing gene expression in samples, for
PT identifying mRNAs expressed at different levels, comprises employing an
PT identimer having a oligo-dT primer of a specific sequence and a
PT detectable marker at its 5' end.
XX
PS Disclosure; Page 11; 45pp; English.
XX
CC The invention relates to systems for identification and characterisation
CC of gene expression in one or more samples, comprising an identimer having
CC a specific oligo-dT primer sequence, where the identimer comprises a
CC detectable marker at its 5' end. The system is useful for identifying any
CC or all genes expressed in a given in vivo or in vitro RNA sample, as well
CC as the relative differences in mRNA between 2 or more samples, where
CC desired, for supporting discovery of new genes, and for identifying mRNAs
CC that are expressed at different levels between 2 or more samples. The new
CC system or method addresses limitations of prior methods by comprising
CC compositions and systems that incorporate new strategies where molecular
CC or biochemical assay compositions and systems are linked to DNA or RNA
CC sequence databases for optimal resource efficiency in assaying gene
CC expression. The system has the following advantages over existing
CC methods: (a) prior sequence information or clone library construction is
CC not needed to enable the assay; (b) provides immediate sequence
CC information in addition to information concerning changes or differences
CC in mRNA level, to determine mRNA expression level and mRNA identification
CC in one assay; (c) generates cDNA fragments from all mRNAs present in the
CC sample for subsequent investigation by common molecular biology
CC techniques; and (d) does not require prior knowledge of the sequence of
CC the genome of the organism under investigation and can be employed in
CC organisms lacking significant genomic sequence in formation. The present
CC sequence represents an oligo dT primer used in the method of the
CC invention

PT   Set of energy-transfer fluorescent labels with donor and acceptor at
PT   different separations - useful for DNA sequencing allows use of fewer
PT   analysing wavelengths or an increased throughput.
XX
PS   Example 1; Page 14; 30pp; English.
XX
CC   The present sequence exxemplified the primer of the invention, and is
CC   used to sequence Incyte clone 1 (AAV42737). The primer of the invention
CC   is labelled with a set of at least 2 different fluorescent labels. The
CC   set comprises an energy-transfer fluorescent label with at least 1 each
CC   of a donor fluorophore and an acceptor fluorophore capable of energy
CC   transfer, and separated by a distance x, and a second similar fluorescent
CC   label in which the separation distance is y, x and y being sufficiently
CC   different for the two fluorescent labels to produce distinct fluorescent
CC   signals. Fluorescent labels are useful in multicomponent analyses, e.g.
CC   as probes for fluorescent in situ hybridisation or especially as primers
CC   for DNA sequencing

PT   New polynucleotide, useful for preparing peptides containing non-cognate
PT   amino acids, encodes ribozyme that can aminoacylate tRNA with such amino
PT   acids.
XX
PS   Example 3; SEQ ID NO 42; 85pp; English.
XX
CC   The invention relates to a novel polynucleotide comprising a sequence
CC   encoding a ribozyme that can aminoacylate tRNA with a non-cognate amino
CC   acid. Ribozymes encoded by the polynucleotide of the invention are used
CC   to prepare polypeptides that contain non-cognate, including non-natural,
CC   amino acids. The invention more specifically provides catalytic RNA
CC   molecules having cis aminoacylation activity with a catalytic and
CC   aminoacylation domain, or an RNA molecule with trans aminoacylation
CC   activity with only a catalytic domain. The products of the invention are
CC   potentially useful for biomedical and therapeutic use, e.g. for probing
CC   the structure and function of proteins; preparation of peptide libraries
```

```
CC   and in proteomics. This polynucleotide sequence represents a DNA oligo

PT   Producing protein or DNA libraries which are useful for improving
PT   existing proteins, by in vitro translating protein coding sequences to
PT   produce RNA-protein fusions and incubating these protein fusions under
PT   high salt conditions.
XX
PS   Disclosure; Page 44; 121pp; English.
XX
CC   The present sequence is one of a number of oligonucleotides which were
CC   used for the generation of RNA-protein fusions, including fusions having
CC   a myc epitope tag. The RNA-protein fusions comprise a protein covalently
CC   linked to the 3' end of its own mRNA. This is accomplished by synthesis
CC   and in vitro or in situ translation of an mRNA molecule with a peptide
CC   acceptor attached to its 3' end. The RNA-protein fusions are incubated
CC   under high salt conditions to produce a protein library. This method is
CC   useful for improving or altering existing proteins, as well as for
CC   isolating new proteins and nucleic acid or small molecule targets. It may
CC   also be used to improve human or humanised single-chain antibodies for
CC   the treatment of a number of diseases. The method is useful for the
CC   isolation of proteins with specific binding properties, for screening
CC   cDNA libraries and cloning new genes on the basis of protein-protein
CC   interactions. Unlike prior art, the new method does not rely on
CC   maintaining the integrity of an mRNA:ribosome:nascent chain ternary
CC   complex, which is very fragile and is therefore of limited use. The
CC   method does not rely on topological links between the protein and the
CC   nucleic acid so that the information of the protein is retained and can
CC   be recovered in readable, nucleic acid form

PT   Rolling circle synthesis of oligo:nucleotide(s) - using primed circular
PT   template to produce oligonucleotide multimer for cleavage.
XX
PS   Example 18; Col 57; 38pp; English.
XX
CC   The present sequence represents an oligonucleotide used in an example of
CC   the present invention. The present invention describes a method for
CC   synthesising a selected oligonucleotide (I) having well defined ends. The
CC   method comprises: (a) annealing a primer to a single-stranded (ss)
CC   circular template to yield a primed circular template, where the template
CC   comprises: (i) at least one nucleotide sequence complementary to (I); and
CC   (ii) at least one nucleotide effective to produce a cleavage site in the
CC   oligonucleotide multimer; (b) combining the primed circular template with
CC   at least two types of nucleotide triphosphates and a polymerase enzyme
CC   without the addition of auxiliary proteins to yield a ss oligonucleotide
CC   multimer complementary to the circular oligonucleotide template,
CC   comprising multiple copies of (I); and (c) cleaving the oligonucleotide
CC   multimer at the cleavage site to produce (I) having well defined ends.
CC   The method is used for the large-scale synthesis of DNA and RNA oligomers
CC   for use, e.g. as probes and diagnostic agents and/or therapeutic agents

PT   Synthesis of oligo:nucleotide(s) - using a single-stranded circular
PT   oligo:nucleotide template ribonucleotide tri:phosphate(s) and a
PT   polymerase to form multimer(s) which can be cleaved.
XX
PS   Example 18; Page 59; 100pp; English.
XX
CC   The oligomer sequence ID No.38 was used in an example of the invention
CC   for synthesising an RNA oligonucleotide, comprising combining a single-
CC   stranded circular oligonucleotide template comprising at least one copy
CC   of a nucleotide sequence complementary to the sequence of the desired RNA
CC   oligonucleotide with at least 2 types of ribonucleotide triphosphate and
CC   a polymerase enzyme to yield a single-stranded RNA oligonucleotide
CC   multimer complementary to the circular oligonucleotide template, where
CC   the RNA oligonucleotide multimer comprises multiple copies of the desired
CC   RNA oligonucleotide. The methods can be used for producing RNA
CC   oligonucleotides having a specific sequence and well defined ends. The
CC   RNA oligonucleotides produced can be used as probes, standards and
CC   diagnostic or therapeutic agents. They can be used for modifying the
CC   structure or function of a target molecule. They can also be used to
CC   cleave disease-associated RNA, DNA or protein

PT   Selection of specific protein by screening protein-RNA fusions generated
PT   in vitro or in situ - useful for, e.g. identifying enzymes and antibodies
PT   with altered properties, potentially useful as catalysts or for therapy
PT   or diagnosis.
XX
PS   Disclosure; Page 40; 94pp; English.
XX
CC   The Oligonucleotides AAV48087, AAV48089-V48091 and AAV48096-V48098 and
CC   variations were used to generate RNA-protein fusions. These were used in
CC   the selection of a specific protein or RNA, by in vitro or in situ
CC   translation of candidate RNA molecules to produce RNA-protein fusions,
CC   then selecting specific RNA protein fusions. The method is used to select
CC   proteins (or DNA encoding them) having altered properties, e.g. for
CC   identification of new binding reagents, to identify improved human
CC   antibodies or new enzymes. These proteins are potentially useful in
CC   diagnosis and therapy, or as industrial catalysts. The methods allow many
CC   rounds of selection and amplification to be performed, resulting in
CC   enrichment of even very rare molecules and allowing isolation of proteins

PT   Use of a live, recombinant leporipox virus in the manufacture of a vector
PT   vaccine for the treatment and/or prophylaxis of infectious disease in non
PT   -lepori species.
XX
PS   Example 1; Page 9; 28pp; English.
XX
CC   The invention relates to the use of a live, recombinant leporipox virus
CC   (which comprises exogenous DNA that is operably linked to at least one
CC   expression control element and is incorporated in a non-essential region
CC   of the virus genome) in the manufacture of a vector vaccine for the
CC   treatment and/or prophylaxis of infectious disease in non-lepori species
CC   such as felines or canines. The present sequence is an oligonucleotide
CC   used to generate pox virus late promoter. This sequence is used in the
CC   exemplification of the invention. (Updated on 07-AUG-2003 to correct OS
CC   field.) (Updated on 29-AUG-2003 to standardise OS field)

XX
PT   Detecting target nucleic acid molecules - using excess complementary
PT   nucleic acid probes and nicking to complete a cycling sequence.
XX
PS   Disclosure; Page 24; 34pp; English.
XX
CC   Probe MRCO46 is bound by a permanent linkage to a solid support at its 3'
CC   end. It is used by reacting excess probe with a target nucleic acid;
CC   nicking hybridised probe at least once within a predetermined sequence to
CC   form 2 or more probe fragments hybridised to the target sequence, which
CC   results in the probe fragments becoming hybridised to another probe; and
CC   identifying probe fragments, so detecting the target sequence. The probe
CC   can react with target sequence to complete a cycling sequence. Using this
CC   system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can
CC   be obtd. The probe is cleavable at the ribonucleotides by a ds RNase, eg
CC   RNase H or ExoIII. (Updated on 31-OCT-2002 to add missing OS field.)

PT   Detecting target nucleic acid molecules - using excess complementary
PT   nucleic acid probes and nicking to complete a cycling sequence.
XX
PS   Disclosure; Page 24; 34pp; English.
XX
CC   Probe MRCO71 is bound by a hydrolysable linkage to a solid support at its
CC   3' end. It is used by reacting excess probe with a target nucleic acid;
CC   nicking hybridised probe at least once within a predetermined sequence to
CC   form 2 or more probe fragments hybridised to the target sequence, which
CC   results in the probe fragments becoming hybridised to another probe; and
CC   identifying probe fragments, so detecting the target sequence. The probe
CC   can react with target sequence to complete a cycling sequence. Using this
CC   system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can
CC   be obtd. The probe is cleavable at the ribonucleotides by a ds RNase, eg
CC   RNase H or ExoIII. (Updated on 31-OCT-2002 to add missing OS field.)

PT   Vaccinating against tumors, infectious diseases, allergies and asthma
PT   using immunostimulatory Py-rich and TG nucleic acids.
XX
PS   Claim 101; Page 56; 338pp; English.
XX
CC   The present invention relates to a method for stimulating an immune
CC   response. The method comprises administering an immunostimulatory nucleic
CC   acid to a non-rodent subject in sufficient quantity to stimulate an
CC   immune response. The present sequence is one such immunostimulatory
CC   nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
CC   (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
CC   against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
CC   and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,
CC   haemophilus, campylobacter, clostridium, Escherichia coli and/or
CC   staphylococcus), fungal antigens and/or parasitic antigens. The method is
CC   also useful for preventing cancer, asthma, infectious disease, allergy or
CC   immune deficiency. The present sequence can also be used to redirect a
CC   Th2 to a Th1 immune response and to activate immune cells. Note: the
CC   present sequence may have a phosphorothioate backbone

PT   Inhibiting angiogenesis in a subject, involves administering at least one
PT   antiangiogenic nucleic acid molecule to the subject.
XX
PS   Claim 2; Page 35; 276pp; English.
XX
CC   The invention relates to inhibiting angiogenesis in a subject, comprising
CC   administering at least one antiangiogenic nucleic acid molecule. Also
CC   included is a kit comprising a first container housing the antiangiogenic
CC   nucleic acids, and instructions for administering them to a subject
CC   having a condition characterised by unwanted angiogenesis. The method is
CC   useful for inhibiting angiogenesis associated with solid tumour growth,
CC   tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis,
CC   diabetic retinopathy, retinopathy of prematurity, macular degeneration,
CC   corneal graft rejection, neovascular glaucoma, retrolental fibroplasia,

PT   New oligomers contg. modified bases - which form a triplex with G-C
PT   doublet in a DNA duplex, for treating and diagnosing HIV, hepatitis,
PT   herpes malignancy and inflammation.
XX
PS   Claim 12; Page 71; 77pp; English.
XX
CC   The synthetic oligomer is capable of forming a triplex at physiological
CC   pH with a purine rich target sequence by coupling into the major groove
CC   of the duplex. The specific target sequence of this oligomer is the human
CC   interleukin 6 gene untranslated sequence contg. a purine rich sequence
CC   concd. on one strand of the duplex. The oligomer, and others like it are
CC   useful in diagnosis and therapy of diseases characterised by specific DNA
CC   duplex targets, e.g. HPV, HER, HIV, hepatitis B, herpes, malignant
CC   tumours and inflammation. The triple helices form under mild conditions
CC   thus assays may be carried out without subjecting the test specimen to
CC   harsh conditions. The oligomer contains an inverted polarity region
CC   formed from an o-xyloso dimer synthon. The linking gp. is o-xyloso
CC   (nucleotides have the 3'positions of xylose sugars linked via the o-
CC   xylene ring). Two nucleotides are coupled through a xylene residue to
CC   form the dimer synthon. This additional modifications may render the
CC   oligomer stable to nuclease activity. The oligomer is able to inhibit
CC   gene expression, as verified by in vitro systems. See also AAQ25452-25501
CC   and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN field.)

PT New variants of the human MLH1 and MSH2 genes for diagnosing or
PT determining a predisposition for hereditary non-polyposis colorectal
PT cancer.
XX
PS Disclosure; Page 4; 38pp; English.
XX
CC The present invention describes a variant human MLH1 or MSH2 gene. Also
CC described are: (1) a method for diagnosing or predicting susceptibility
CC to hereditary non-polyposis colorectal cancer (HNPCC), comprising
CC screening a DNA sample for the variant MLH1 or MSH2 gene where presence
CC of the variant indicates presence of, or susceptibility to HNPCC; (2) a
CC method of identifying mutants in splice donor or acceptor sites of a
CC human MLH1 gene, comprising sequencing splice donor or acceptor sites of
CC the gene with intronic primers for the human MLH1 gene and analysing the
CC sequence to identify any mutants; (3) a method of identifying mutants in
CC splice donor or acceptor sites of a human MSH2 gene, comprising
CC sequencing splice donor or acceptor sites of the gene with intronic
CC primers for the human MSH2 gene and analysing the sequence to identify
CC any mutants; and (4) a transgenic model system for colorectal cancer
CC comprising cells expressing the variant MLH1 or MSH2 gene. The hMLH1 and
CC hMSH2 variants are used to diagnose or determine a patients
CC susceptibility to hereditary non-polyposis colorectal cancer. ABL01648 to
CC ABL01745 and ABL01746 to ABL01831 represent hMLH1 and hMSH2 gene
CC fragments from the present invention. ABL01832 to ABL01839 represent
CC mutagenic primers used in the exemplification of the present invention

PT   New sequence determination oligonucleotides, useful for detecting
PT   polymorphic sites in a 5' flanking region of a CYP2D6 gene, as
PT   hybridization probes, as components of diagnostic assays, or in ligase-
PT   based sequence determination.
XX
PS   Claim 2; Page 23; 63pp; English.
XX
CC   The invention relates to sequence determination oligonucleotides for
CC   detecting polymorphic sites in a 5' flanking region of cytochrome P450
CC   2D6 (CYP2D6) gene. CYP2D6 enzymes are involved in the metabolism of many
CC   different xenobiotics. Human CYP2D6 gene is located on chromosome 22. The
CC   oligonucleotides may be used as in situ hybridisation probes, in ligase-
CC   based sequenced determination, as components of diagnostic assays, as
CC   probes in sequence determination methods based on mismatches, as
CC   hybridisation-based diagnostic assays, and as components of diagnostic
CC   microarray. CYP2D6 is useful to predict variations in an individual's
CC   ability to metabolise certain drugs. The present sequence is a sense
CC   oligonucleotide used for detecting of human CYP2D6 gene 5' flanking
CC   region single nucleotide polymorphism (SNP)

PT Novel human phosphodiesterase polypeptide, zcytor13 and polynucleotide
PT encoding it, for detecting human chromosomal abnormalities, identifying
PT modulators and treating inflammatory and cardiovascular diseases.
XX
PS Example 1C; Page 118; 122pp; English.
XX
CC The patent discloses novel human phosphodiesterase (PDE), zcytor13 cDNA
CC and its corresponding protein. Zcytor13 protein is used to promote wound
CC healing in tissues, to exhibit anti-bacterial and anti-viral effects and
CC to identify modulators (e.g. agonists or antagonists). Zcytor13, its
CC agonists or antagonists are useful in the treatment of inflammatory heart
CC or cardiovascular conditions, muscle inflammation, inflammation during
CC and after surgery, arthritis, asthma, inflammatory bowel disease or
CC diverticulitis, for modulating spermatogenesis, sperm capacitation, as
CC immunocontraceptive or anti-fertility vaccine and for treating male
CC infertility. Zcytor13 protein and its antibodies are used to diagnose
CC cancer, reperfusion ischaemia, asthma, psoriasis and melanoma. Zcytor13
CC proteins are used to enhance fertilisation. Zcytor13 antagonists are used
CC to treat myocarditis, atherosclerosis, pelvic inflammatory disease (PID),
CC psoriasis, eczema, scleroderma and other inflammatory diseases. Zcytor13
CC sequences and/or its antibodies are useful for treatment of disorders
CC associated with vasoconstriction, heart arrhythmia, congestive heart
CC disease, muscle spasms and fatigue. They are used for detecting human
CC chromosomal abnormalities. Zcytor13 cDNAs are used in gene therapy.
CC Zcytor13-cytokine fusion proteins or antibody-cytokine fusion proteins
CC are useful for enhancing in vivo killing of target tissue. The present
CC sequence is a polyA PCR primer, ZC7764b which is used to isolate full
CC length zcytor13 cDNA by screening human placental cDNA library

PT Polynucleotides encoding salivary proteins useful as anti-microbial
PT agents.
XX
PS Example 1; Col 53; 29pp; English.
XX
CC The invention relates to a polynucleotide derived from the 4q12-4q13
CC region of human chromosome 4 and encoding a zsig63 polypeptide, a
CC secreted salivary protein with anti-microbial activity. Due to their
CC microbial activity, the sequences can be used in the study of microbial
CC infections, e.g. for recombinant production of anti-microbial proteins.
CC The sequences can be used in the treatment of tooth decay, periodontal
CC disease, thrush, gastrointestinal disease, urinary tract infections,
CC vaginal infections, skin infections, epithelial wounds, chronic tissue
CC damage, acquired immunodeficiency syndrome (AIDS), cystic fibrosis, lung
CC infections, sarcoidosis, emphysema and chronic bronchitis. This sequence
CC represents a sequencing primer for cDNA encoding human zsig63

PT Novel secreted salivary protein, zsig63 and polynucleotide encoding it
PT useful for treating microbial infections, inflammatory conditions, dental
PT caries and lung infections associated with cystic fibrosis.

```
XX
PS   Example 1; Page 29; 33pp; English.
XX
CC   The present invention relates to a new secreted salivary protein, zsig63.
CC   The invention is useful for detecting in a test sample, the presence of
CC   an antagonist or agonist of zsig63 protein activity. The invention is
CC   also useful as an immunogen for producing an antibody to zsig63
CC   polypeptide. zsig63-cytokine fusion proteins or antibody-cytokine fusion
CC   protein are useful for enhancing in vivo killing of target tissues.
CC   Pharmaceutical composition comprising purified zsig63 polypeptide are
CC   useful in the treatment of conditions associated with pathological
CC   microbes, including bacterial, fungal and viral infections. High
CC   expression of zsig63 in salivary gland suggests that anti-microbial
CC   polypeptides are useful for treatment of dental caries (tooth decay),
CC   periodontal disease, thrush and gastrointestinal disease. Other
CC   applications can be used in urinary tract infections, vaginal infections,
CC   prevention of infection in skin and other epithelial wounds. The
CC   polypeptides can be used to establish normal microflora and protect
CC   against pathogenic colonisation and invasion. The invention is useful
CC   when pro-inflammatory activity is desired. Applications for such pro-
CC   inflammatory activity include the treatment of chronic tissue damage,
CC   particularly in areas having a limited or damaged vascular system e.g.,
CC   damage in extremities associated with diabetes. Antagonists to zsig63
CC   polypeptides may be useful as anti-inflammatory agents. The invention is
CC   useful for the treatment of patients having incompetent immune system,
CC   such as AIDS (acquired immunodeficiency syndrome) patients or individuals
CC   that have undergone chemotherapy, radiation treatment. The invention is
CC   also useful for the treatment of lung infections associated with cystic
CC   fibrosis and its agonists or antagonists are useful for aiding digestion.
CC   The present nucleic acid sequence represents a PCR primer that was used
CC   in the methods of the invention for identification of zsig63

PT   Novel secreted salivary polypeptide, zsig63, useful as antimicrobial
PT   agent for treating microbial infection, dental carries, periodontal
PT   disease, thrush gastrointestinal disease, and for aiding digestion.
XX
PS   Example 1; Page 30; 33pp; English.
XX
CC   The invention relates to human secreted salivary polypeptide designated
CC   as zsig63 and nucleic acid molecules encoding such polypeptides. zsig63
CC   can be used in detecting agonists and antagonists of its activity, and is
CC   also useful as a host defense polypeptide, immune modulating factor,
CC   antipathogenic polypeptide, cell-cell signalling molecule, growth factor,
CC   cytokine, or as secreted extracellular matrix associated proteins with
CC   growth factor hormone activity. It is useful for treating conditions
CC   associated with pathological microbes, including bacterial, fungal and
CC   viral infections, for treating dental carries (tooth decay), periodontal
CC   disease, thrush and gastrointestinal disease, for treating urinary tract
CC   infection, vaginal infection and for preventing infection in skin and
CC   other epithelial wounds. zsig63 is useful for establishing normal
CC   microflora and protect against pathogenic colonisation and invasion, for
CC   treating chronic tissue damage e.g. damage in extremities associated with
CC   diabetes and useful as anti-inflammatory agents. It is useful as a marker
CC   of lung dysfunction, salivary gland dysfunction, or dysfunction of
CC   prostate gland. It is also therapeutically useful for aiding digestion.
CC   Polynucleotides of the invention are used in gene therapy for increasing
CC   or inhibiting zsig63 activity, for detecting abnormalities on human
CC   chromosome 4 associated with disease or other human traits and as
CC   diagnostics in forensic DNA profiling. Sequences of the invention are
CC   useful for stimulating proliferation or differentiation of cardiac
CC   myocytes, for proliferation or differentiation of adipocytes and for
CC   inhibiting chondrosarcomas, atherosclerosis, restenosis and obesity. The
CC   present sequence is a primer used in the identification of human zsig63
CC   DNA

PT New zalpha11 ligand polypeptides and polynucleotides, useful for
PT stimulating proliferation, activation, differentiation and/or induction
PT of inhibition of specialized cell function, or for stimulating an
PT antigenic response.
XX
PS Example 7; Col 139; 105pp; English.
XX
CC The present invention relates to the isolation of a novel cytokine,
CC zalpha11 Ligand and the polynucleotide encoding it. The invention also
CC gives the sequence for the zalpha11 receptor and the polynucleotide
CC encoding it. The zalpha11 Ligand polypeptide stimulates proliferation of
CC natural killer (NK) cells or NK cell progenitors, the activation of NK
CC cells, proliferation of T-cells, proliferation of B-cells stimulated with
CC anti-CD40 antibodies, stimulates an antigenic response in a mammal, and
CC reduces proliferation of B-cells stimulated with anti-IgM antibodies. The
CC zalpha11 Ligand polypeptide is also useful in preparing antibodies that
CC bind to zalpha11 Ligand epitopes. The zalpha11 Ligand polynucleotides can
CC be used as probes or primers to clone regions of a zalpha11 Ligand gene,
CC and in gene therapy. Zalpha11 Ligand may also be used to identify
CC inhibitors of its activity, to enhance the generation of anti-tumour
CC responses with or without the infusion of donor lymphocytes, and to
CC activate or stimulate the immune system. The present sequence represents
CC a sequencing primer used to sequence cDNA clones in the isolation of
CC human zalpha11 Ligand

PT Novel isolated zsig63 polypeptide, member of the adhesin family, useful
PT for treating dental carries, periodontal disease, thrush,
PT gastrointestinal disease, urinary tract infections, vaginal infections,
PT skin infections.
XX
PS Example 1; Page 29; 32pp; English.
XX
CC The invention relates to an isolated zsig63 polypeptide comprising at
CC least 90% identity to an amino acid sequence which comprises domain 1 of
CC zsig63, domain 2, domain 3, mature zsig63 and full length zsig3. Also
CC included are the polynucleotide encoding zsig63, a zsig63 expression
CC vector, a cultured cell comprising the vector and expressing the protein,
CC a DNA encoding a fusion protein (comprising amino acids 1-15, 16-37, 38-
CC 126, 127-219 or 16-219 of zsig63 and an additional protein), using a
CC zsig63 reporter gene construct to identify zsig63 agonists, and producing
CC an anti-zsig63 antibody using zsig63 immunogenic peptides, Zsig63 is
CC useful for detecting in a test sample, the presence of antagonist of
CC zsig63 protein activity. Zsig63 has antimicrobial activity and since
CC exhibits high expression in salivary gland, can be used for treating
CC dental carries, periodontal disease, thrush, and gastrointestinal
CC disease, urinary tract infections, vaginal infections, skin infections
CC and other epithelial wounds. The polypeptides can be used to establish
CC normal microflora and protect against pathogenic colonization and
CC invasion. Zsig63 can also be used for providing pro-inflammatory activity
CC for treating chronic, tissue damage particularly in areas having limited
CC or damaged vascular system, e.g. in diabetes, and for treating
CC immunocompromised AIDS patients or in individuals that have undergone
CC chemotherapy, radiation treatment, for treating lung infections e.g. in
CC cystic fibrosis. Detection of zsig63 polypeptide at relatively high
CC levels in the trachea may indicate that such polypeptides may serve as a
CC marker of lung dysfunction. Zsig63 is also useful in diagnosing
CC conditions associated with salivary gland or lung dysfunction including
CC salivary gland carcinoma, Pneumocystis carinii infection, emphysema,
CC chronic bronchitis, prostate dysfunctions such as prostate
CC adenocarcinoma, aiding digestion, and as components of defined cell
CC culture media and may be used to replace serum that is commonly used in
CC culture. The DNA is useful in gene therapy applications to increase or
CC inhibit zsig63 activity, and for detecting abnormalities on human
CC chromosome 4 (e.g. 4q12-4q13, associated with dentinogenesis imperfecta,
CC and dentin dysplasia type II). Zsig63 is an adhesin family member. The
CC present sequence is a primer used to isolate and sequence nucleic acdis
CC encoding human zsig63

PT   Isolating genes encoding proteins with selected properties, useful for
PT   identifying therapeutic agents or targets.
XX
PS   Disclosure; Page 66; 136pp; English.
XX
CC   The invention relates to the identification of a recombinant nucleic acid
CC   encoding an exogenous protein having a selected property. The method
CC   comprises preparing a population of eukaryotic host cells, culturing the
CC   cells under suitable conditions and identifying cells that contain the
CC   recombinant nucleic acid. The method is used to sort genes according to
CC   the type of proteins they express, and also to identify new ligand/
CC   receptor interactions. Typical applications of the nucleic acid and the
CC   exogenous protein are in isolation of new growth factors, cytokines,
CC   membrane receptors, cytoplasmic, organelle or nuclear proteins, all of
CC   which may be useful as therapeutic agents or therapeutic targets, e.g.
CC   apoptosis-promoting or tumour suppressing proteins, regulators of cell
CC   proliferation or metabolic processes etc. The protein can also be used to
CC   screen for specific modulators. The nucleic acid can also be used as
CC   sources of therapeutic antisense or ribozyme sequences. The method allows
CC   the protein (rather than a partial DNA sequence) to be isolated and,
CC   since a wide range of cells can be used, they can be expressed with the
CC   correct glycosylation pattern

PT   Identifying a recombinant nucleic acid to identify and isolate various
PT   cellular proteins, comprises culturing a composition comprising
PT   eukaryotic host cells and identifying a cell comprising recombinant
PT   nucleic acid.
XX
PS   Example; Page 35; 56pp; Japanese.
XX
CC   The invention relates to the identification of a recombinant nucleic acid
CC   encoding an exogenous protein having a selected property.The method
CC   comprises preparing populations of eukaryotic host cells, where each cell
CC   comprises an expression vector encoding a different exogenous protein.
CC   The host cells are cultured under suitable conditions and the nucleic
CC   acid which encodes the exogenous protein is identified. The method is
CC   useful for the identification and isolation of proteins with a selected
CC   property. Typical applications of the nucleic acid and the exogenous
CC   protein are in isolation of new growth factors, cytokines, membrane
CC   receptors, cytoplasmic, organelle or nuclear proteins, all of which may
CC   be useful as therapeutic agents or therapeutic targets, e.g., pro-
CC   apoptotic or tumour suppressing proteins, regulators of cell
CC   proliferation or of metabolic processes. The protein can also be used to
CC   screen for ligands and specific modulators of activity. The method of the
CC   invention allows the direct cloning of full length cDNAs in one step. It
CC   facilitates direct expression of the protein without the need to perform
CC   further procedures such as subcloning and establishment of a cell line
CC   for protein production. The method allows a protein of interest (rather
CC   than a partial DNA sequence) to be isolated and, since a wide range of
CC   cell types can be used, they can be expressed in a correctly folded and
CC   glycosylated form. Sequences AAA90394-A90395 represent Sindbis virus
CC   reverse transcription-PCR (RT-PCR) primers used in the exemplifications
CC   of the invention. This patent is related to WO9925876

PT Determining the concentration of a target nucleic acid, useful e.g. for
PT detecting genetic mutations, comprises using a fluorescently labeled
PT probe in which emission is reduced by binding to the target nucleic acid.
XX
PS Example 5; Page 21; 55pp; English.
XX
CC The invention relates to the determination of the concentration of a
CC nucleic acid target, using a fluorescently labeled probe which produces
CC reduced fluorescence emission when hybridised to the target nucleic acid.
CC The method comprises measuring the reduction in emission caused by
CC hybridisation. The new method is particularly used to quantify target
CC nucleic acids by a real-time polymerase chain reaction, e.g. for
CC quantifying microbial cells in co-cultures or symbiotic systems, for
CC detecting gene mutations or polymorphisms, and for analysing melting
CC curves of target nucleic acids to determine a Tm value. Methods of the
CC invention allow target nucleic acids to be quantified quickly, easily and
CC accurately. Particularly there is no need to remove unbound probe, and no
CC materials are introduced that inhibit amplification by Taq polymerase (so
CC conventional PCR conditions can be used). The specificity of PCR is kept
CC high (amplification of primer dimers is delayed), and the limit of
CC quantitation is reduced. Complex probes are not needed, and amplification
CC can be monitored in real time. The working graph for data analysis
CC (automatically generated by a computer) has a higher correlation
CC coefficient than conventional graphs so more accurate quantitation is
CC possible. The current sequence represents a synthetic
CC deoxyribooligonucleotide that was used for investigating the base
CC selectivity of a target nucleic acid

PT Determining proliferative capacity of cells, useful e.g. for detecting
PT tumor cells, by measuring concentration and subcellular localization of
PT adenomatous polyposis coli protein.
XX
PS Claim 10; Page 12; 26pp; German.
XX
CC This invention describes a novel method for determining the proliferative
CC activity of cells, comprising detecting, in a sample, the concentration
CC and/or subcellular localization of APC (adenomatous polyposis coli)
CC protein (I). The invention also describes (1) determining function of (I)
CC in a sample by detecting presence of the C-terminal, DNA-binding domain
CC of (I); (2) detecting mutations in (I)-encoding nucleic acid by detecting
CC the DNA-binding domain of (I); (3) purifying, enriching and/or detecting
CC (I) or its fragments by reaction with a probe; (4) double-stranded DNA
CC (II) that contains the sequence GGCCGCA_2_3G (S1) and/or GATCCT_2_3GC
CC (S2); (5) peptide fragment of (I) containing at least the DNA-binding
CC domain; (6) antibodies (Ab) directed against an epitope of positions 1340
CC -1901, 2219-2580 or 2581-2843 of (I); (7) set of two or more antibodies,
CC one of which is Ab and the other directed against the N-terminal region
CC (1-1299) of (I); and (8) kit for detecting DNA-binding capacity of (I) or
CC its fragments in a sample consisting of (II), Ab or the set of (7). The
CC method is used to detect proliferative, especially tumor (precursor),
CC cells, to detect function of (I) and mutations in (I), and to purify
CC and/or enrich (I), or its fragments, from a sample. The method allows
CC simple, rapid and reliable detection of proliferation, without the need
CC for polymerase chain reaction or sequencing

PT   Detecting an analyte in a sample comprises providing nucleic acid
PT   sequence which is catalytically active in presence of analyte, contacting
PT   catalytic nucleic acid with substrate and amplifying catalytic product.
XX
PS   Disclosure; Page; 36pp; English.
XX
CC   The invention relates to a method of detecting an analyte in a sample.
CC   The method comprises providing a nucleic acid sequence which is initially
CC   catalytically inactive, but which becomes catalytically active in the
CC   presence of an analyte (the effector); providing a nucleic acid substrate
CC   for the catalytic activity of the nucleic acid sequence; and contacting
CC   the nucleic acid sequence and the substrate with the sample under
CC   conditions allowing catalytic activity of nucleic acid sequences. The
CC   catalytic nucleic acid sequence will be able to convert the nucleic acid
CC   substrate into a nucleic acid product only if the analyte of interest is
CC   present. The nucleic acid catalytic product is then amplified, and a
CC   significant increase in the amount of product indicates the presence of
CC   the analyte in the sample. The method is useful for the qualitative or
CC   quantitative determination of an analyte in a sample in diagnostic
CC   assays. The invention describes the in vitro selection of a ribozyme
CC   ligase (L1; AAA57859, AAA57860) which is catalytically active only in the
CC   presence of an oligonucleotide effector (AAA57854). The L1 ribozyme
CC   ligase was selected from a pool of RNA molecules comprising a central
CC   randomised region 90 nucleotides in length flanked on both sides by
CC   constant sequence regions (the N90 RNA pool; AAA57851). In the presence
CC   of the effector, selection was performed using one of the tagged
CC   substrate molecules AAA57855-A57857. RNAs with ligase activity (i.e.,
CC   those which have become ligated to the substrate molecule) were reverse
CC   transcribed using the effector oligo, and then PCR amplified using the
CC   effector and a DNA primer identical in sequence to the substrate used for
CC   the selection. A ribozyme ligase, L1, was selected via this procedure. L1
CC   can only adopt its active conformation (AAA57859) in the presence of the
CC   effector oligo (analyte). In the absence of the effector, L1 adopts an
CC   inactive conformation (AAA57860). The present sequence represents the
CC   deoxy-T22-tagged substrate oligonucleotide. The dT22 tag enables
CC   successfully ligated products to be isolated using oligo(dA) cellulose
CC   Type 7. Note: The present sequence is not given in the specification, but
CC   is created from the inforamtion given on page 11

PT   Inserting a nucleic acid into a circular vector comprising joining their
PT   ends, melting, and reannealing ends at two different concentrations,
PT   useful for cloning small amounts of nucleic acids and forming genomic
PT   libraries.
XX
PS   Example 3; Page 67; 71pp; English.
XX
CC   This invention describes a novel method (M1) for inserting a nucleic acid
```

```
CC   (N1) into a circular vector (V1) comprising joining ends of N1 and V1
CC   under a first nucleic acid concentration, melting hybridized cohesive
CC   circularization ends, and reannealing the ends at a second concentration.
CC   The methods are useful for the cloning small amounts of nucleic acids and
CC   forming genomic libraries of complex populations of DNA or cDNA. The
CC   methods allow the cloning of minute amounts of nucleic acids efficiently
CC   and avoids the size selection problems of prior art systems. Larger
CC   nucleic acid fragments are just as easily cloned, allowing highly
CC   representative libraries to be made. Vector to vector ligation is avoided
CC   using the methods. AAA40351-A40366 represents primers used to illustrate
CC   the method of the invention

PT   Detecting nucleic acid having two portions, by providing nanoparticles
PT   having oligonucleotides attached to it, contacting nucleic acid and
PT   nanoparticles to allow hybridization, and observing detectable change.
XX
PS   Disclosure; Page 57; 442pp; English.
XX
CC   The invention describes a method of detecting (M1) a nucleic acid having
CC   two portions, involving providing nanoparticles having oligonucleotides
CC   attached to it, which has a sequence complementary to sequence of two
CC   portions of nucleic acid, contacting nucleic acid and nanoparticles, to
CC   allow hybridisation of oligonucleotides with two or more portions of
CC   nucleic acid, and observing a detectable change brought about by
CC   hybridisation. (M1), nanoparticles (I), nanoparticle-oligonucleotide
CC   conjugates (II) and the aggregate probe are useful for detecting two or
CC   more nucleic acids (from a biological source) having at least two
CC   portions, such as viral RNA, bacterial or fungal DNA, a gene associated
CC   with a disease, synthetic, or structurally-modified natural or synthetic
CC   RNA or DNA, or a product of a polymerase chain reaction amplification.
CC   (II) is useful for preparing a nanoprobe conjugate for detecting an
CC   analyte, and for detecting a nucleic acid bound to an electrode surface.
```

```
CC   (I) and (II) are useful for fabrication, and for separating a selected
CC   nucleic acid having two portions from other nucleic acids. (I), (II) and
CC   the aggregate probe are useful for detecting an analyte (especially
CC   polyvalent analyte) in a sample. This sequence represents a
CC   polynucleotide used to demonstrate the method of the invention

PT   Synthesis of oligo:nucleotide(s) - using a single-stranded circular
PT   oligo:nucleotide template ribonucleotide tri:phosphate(s) and a
PT   polymerase to form multimer(s) which can be cleaved.
XX
PS   Example 2; Page 36; 100pp; English.
XX
CC   The linear multimer was produced by rolling circle synthesis in an
CC   example of the method of the invention for synthesising an RNA
CC   oligonucleotide, comprising combining a single-stranded circular
CC   oligonucleotide template comprising at least one copy of a nucleotide
CC   sequence complementary to the sequence of the desired RNA oligonucleotide
CC   with at least 2 types of ribonucleotide triphosphate and a polymerase
CC   enzyme to yield a single-stranded RNA oligonucleotide multimer
CC   complementary to the circular oligonucleotide template, where the RNA
CC   oligonucleotide multimer comprises multiple copies of the desired RNA
CC   oligonucleotide. The methods can be used for producing RNA
CC   oligonucleotides having a specific sequence and well defined ends. The
CC   RNA oligonucleotides produced can be used as probes, standards and
CC   diagnostic or therapeutic agents. They can be used for modifying the
CC   structure or function of a target molecule. They can also be used to
CC   cleave disease-associated RNA, DNA or protein

XX
PT   Synthesizing RNA oligonucleotide involves combining single-stranded
PT   circular oligonucleotide, ribonucleotide triphosphate and polymerase
PT   enzyme to yield desired RNA complementary to circular oligonucleotide
PT   template.
XX
PS   Example 2; SEQ ID NO 6; 78pp; English.
XX
CC   The invention relates to a method for synthesising an RNA
CC   oligonucleotide, comprising combining a single-stranded circular
CC   oligonucleotide template with at least two types of ribonucleotide
CC   triphosphate and a polymerase enzyme to yield a single-stranded RNA
CC   oligonucleotide multimer complementary to the circular oligonucleotide
CC   template, where the RNA oligonucleotide multimer comprises multiple
CC   copies of the desired RNA oligonucleotide. The method is useful for
CC   synthesising an RNA oligonucleotide with well-defined ends. The circular
CC   oligonucleotide is introduced into the cell using direct injection,
CC   electroporation, calcium phosphate treatment, lipid-mediated delivery, or
CC   cation-mediated delivery. The method is useful for treating bacterial
CC   and/or viral infections in mammals, particularly drug resistant
CC   infections, and for producing double stranded DNA oligomers. The method
CC   is performed in the absence of an oligonucleotide primer, or without the
CC   addition of auxiliary proteins. This sequence represents an
CC   oligonucleotide used in the method of the invention.

PT   Synthesis of branched polymers and novel branched polymeric structures -
PT   used as molecular probes esp. for detecting poly-nucleotide(s).
XX
PS   Example 8; Page 33; 52pp; English.
XX
CC   The sequences given in AAQ83938, AAQ83952 and AAQ83940 are used in the
CC   construction of an oligonucleotide clamp. The clamp is a comb-type
CC   branched polymer which has 3' termini and was used to bind a target
CC   sequence comprising a segment of the HIV pol and nef genes in single
CC   stranded or double stranded forms. An oligonucleotide clamp is a compound
CC   capable of forming a covalently closed macromolecule or a stable circular
CC   complex after specifically binding to the target polynucleotide.
CC   Oligonucleotide clamps generally comprise one or more oligonucleotide
CC   moieties capable of specific binding to the target molecule and one or
CC   more pairs of binding moieties covalently linked to the oligonucleotide
CC   moieties. Upon annealing of the oligonucleotides moieties to the target
CC   polynucleotide, the binding moieties of a pair are bought into
CC   juxtaposition so that they form a stable covalent or non-covalent linkage
CC   or complex. The interaction of the binding moieties effectively clamps
CC   the specifically annealed oligonucleotide moieties to the target
CC   polynucleotide. (Updated on 25-MAR-2003 to correct PN field.)

PT   Determining the concentration of a target nucleic acid, useful e.g. for
PT   detecting genetic mutations, comprises using a fluorescently labeled
PT   probe in which emission is reduced by binding to the target nucleic acid.
XX
PS   Example 5; Page 21; 55pp; English.
XX
CC   The invention relates to the determination of the concentration of a
CC   nucleic acid target, using a fluorescently labeled probe which produces
CC   reduced fluorescence emission when hybridised to the target nucleic acid.
CC   The method comprises measuring the reduction in emission caused by
CC   hybridisation. The new method is particularly used to quantify target
CC   nucleic acids by a real-time polymerase chain reaction, e.g. for
CC   quantifying microbial cells in co-cultures or symbiotic systems, for
CC   detecting gene mutations or polymorphisms, and for analysing melting
CC   curves of target nucleic acids to determine a Tm value. Methods of the
CC   invention allow target nucleic acids to be quantified quickly, easily and
CC   accurately. Particularly there is no need to remove unbound probe, and no
CC   materials are introduced that inhibit amplification by Taq polymerase (so
CC   conventional PCR conditions can be used). The specificity of PCR is kept
CC   high (amplification of primer dimers is delayed), and the limit of
CC   quantitation is reduced. Complex probes are not needed, and amplification
CC   can be monitored in real time. The working graph for data analysis
CC   (automatically generated by a computer) has a higher correlation
CC   coefficient than conventional graphs so more accurate quantitation is
CC   possible. The current sequence represents a synthetic
CC   deoxyribooligonucleotide that was used for investigating the base
CC   selectivity of a target nucleic acid

PT   Synthesizing branched nucleic acids useful as diagnostic and molecular
PT   probes, involves combining first units having haloalkylamino groups and
PT   second units having thiol or phosphorothioate groups.
XX
PS   Example 8; Col 19; 20pp; English.
XX
CC   The present invention relates to a method for synthesising a branched or
CC   multiply connected macromolecular structure, comprising oligonucleotide
CC   clamps (OC). The macromolecular structure is capable of specifically
CC   binding to a target molecule, and can therefore be used as probes. At
CC   least one OC comprises a target binding sequence that binds specifically
CC   and stably with the target molecule, and at least two OCs comprise signal
CC   generation moieties capable of generating a detectable signal in the
CC   presence of the target molecule. In addition the OCs are connected to one
CC   another by thioalkylamino, or thiophosphorylalkylamino bridges. The
CC   present sequence is an OC used in the present invention

PT   Producing encapsidated RNA virus by coexpressing RNA virus genomic
PT   sequence linked to bacteriophage promoter, and coding sequence for
PT   bacteriophage polymerase linked to poxvirus promoter in eukaryotic cell
PT   cytoplasm.
XX
PS   Disclosure; Page 38; 49pp; English.
XX
CC   The patent discloses methods to produce RNA viral sequences, recombinant
CC   RNA viruses, mutants of RNA viruses and RNA virus-derived vectors in cell
CC   culture and in vitro using non-viable, replication defective helper
CC   vaccinia recombinants. These methods generate RNA viral genomes and viral
CC   particles in cell culture and in vitro independent of their natural
CC   replication pathways, bypassing the limitation of any cellular barriers.
CC   The invention also relates to a method for producing encapsidated RNA
CC   virus comprising coexpressing polypeptide coding sequences capable of
CC   forming capsid and packaging RNA viral genomic sequence in eukaryotic
CC   cell, a construct comprising RNA viral genomic sequence linked to
CC   bacteriophage promoter and transcription terminator and bacteriophage
CC   polymerase coding sequence, which is operably compatible with the
CC   promoter and is linked to poxvirus promoter. The methods are useful for
CC   producing infectious or non-infectious, replication-defective,
CC   encapsidated RNA viruses such as hepatitis virus comprising an RNA genome
CC   e.g. hepatitis C virus (HCV), immature hepatitis B virus or hepatitis A
CC   virus, lentivirus, rhinovirus, influenza virus, LCMV, arenavirus,
CC   parainfluenza virus, reovirus, rotavirus, astrovirus, filovirus, or
CC   coronavirus. They are preferably useful for producing encapsidated human
CC   immunodeficiency virus (HIV)-1, where the HIV-1 lacks a Rev-response
CC   element (RRE) or an envelope sequence. Methods of the invention are also
CC   useful for producing replication defective gene transfer and gene therapy
```

```
CC   vectors, particularly to transfer nucleic acids to human cells in vivo
CC   and in vitro. The methods can be used for packaging therapeutic sequences
CC   as gene therapy vector preparations that are substantially free of helper
CC   virus and used as pharmaceuticals in e.g. gene replacement therapy, or
CC   cancer therapy. The present sequence is an oligonucleotide which is
CC   related to a method for production of RNA viruses

CC Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide
CC primer extension (SNPE) primers, and the sequences of regions flanking
CC sites of single nucleotide polymorphisms SNPs. The present invention
CC includes kits for determining the presence or absence of a SNP, using the
CC oligonucleotides of the invention. The PCR primers are used to amplify a
CC SNP flanking sequence, the SNPE primer is used as a genotyping primer.
CC The oligonucleotides are useful for genotyping a nucleic acid sample by
CC performing a single-nucleotide primer extension reaction. The
CC oligonucleotides are useful for determining the presence, absence or
CC identity of a SNP and for genotyping nucleic acid samples, for e.g. to
CC assess by association analysis the genotype of an individual or group of
CC individuals, having a pathological phenotypic trait suspected of being
CC caused by one or more SNPs. Phenotypic traits include diseases e.g.
CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
CC dystrophy, familial hypercholesterolaemia, polycystic kidney disease,
CC osteogenesis imperfecta and acute intermittent porphyria. Phenotypic
CC traits also include symptoms of or susceptibility to multifactorial
CC disease of which a component is or may be genetic such as autoimmune
CC diseases, including, rheumatoid arthritis, multiple sclerosis,
CC inflammation, cancer, nervous system diseases and infection by pathogenic
CC microorganism. The method is also useful in forensic investigations and
CC paternity analysis. The present sequence represents a single nucleotide
CC primer extension (SNPE) primer specific for a human SNP containing DNA
CC sequence

PT   Polymerase chain reaction and primers for detecting nucleic acids from
PT   the diabetogenic coxsackie B virus-4 strain VD2921.
XX
PS   Example 5; Page 44; 79pp; English.
XX
CC   The invention describes a polymerase chain reaction (PCR) and primers for
CC   detecting nucleic acids from the diabetogenic coxsackie B virus-4 (CBV-4)
CC   strain VD2921, (particularly VP1, VP2, VP3, VP4, P2A, P2B, P2C, P3A, P3B,
CC   P3C and P3D nucleic acids). The methods and primers are used for the
CC   detection of CBV-4 strain VD2921 which is associated with diabetes
CC   (diabetogenic enterovirus). Early detection of the diabetes e.g.
CC   detection of diabetogenic enteroviral RNA in peripheral mononuclear
CC   cells, can improve prognosis by allowing treatment e.g. with antiviral
CC   drugs, to prevent further loss of beta cells and severe long term
CC   consequences of diabetes including blindness, renal failure and leg
CC   amputations. This sequence represents a primer used to determine the
CC   genomic structure of diabetogenic coxsackie B virus 4 (CBV-4) strain

PT   Detecting an analyte in a sample comprises providing nucleic acid
PT   sequence which is catalytically active in presence of analyte, contacting
PT   catalytic nucleic acid with substrate and amplifying catalytic product.
XX
PS   Disclosure; Page; 36pp; English.
XX
CC   The invention relates to a method of detecting an analyte in a sample.
CC   The method comprises providing a nucleic acid sequence which is initially
CC   catalytically inactive, but which becomes catalytically active in the
CC   presence of an analyte (the effector); providing a nucleic acid substrate
CC   for the catalytic activity of the nucleic acid sequence; and contacting
CC   the nucleic acid sequence and the substrate with the sample under
CC   conditions allowing catalytic activity of nucleic acid sequences. The
CC   catalytic nucleic acid sequence will be able to convert the nucleic acid
CC   substrate into a nucleic acid product only if the analyte of interest is
CC   present. The nucleic acid catalytic product is then amplified, and a
CC   significant increase in the amount of product indicates the presence of
CC   the analyte in the sample. The method is useful for the qualitative or
CC   quantitative determination of an analyte in a sample in diagnostic
CC   assays. The invention describes the in vitro selection of a ribozyme
CC   ligase (L1; AAA57859, AAA57860) which is catalytically active only in the
CC   presence of an oligonucleotide effector (AAA57854). The L1 ribozyme
CC   ligase was selected from a pool of RNA molecules comprising a central
CC   randomised region 90 nucleotides in length flanked on both sides by
CC   constant sequence regions (the N90 RNA pool; AAA57851). In the presence
CC   of the effector, selection was performed using one of the tagged
CC   substrate molecules AAA57855-A57857. RNAs with ligase activity (i.e.,
CC   those which have become ligated to the substrate molecule) were reverse
CC   transcribed using the effector oligo, and then PCR amplified using the
CC   effector and a DNA primer identical in sequence to the substrate used for
CC   the selection. A ribozyme ligase, L1, was selected via this procedure. L1
CC   can only adopt its active conformation (AAA57859) in the presence of the
CC   effector oligo (analyte). In the absence of the effector, L1 adopts an
CC   inactive conformation (AAA57860). The present sequence represents the
CC   deoxy-A22-tagged substrate oligonucleotide. The dA22 tag enables
CC   successfully ligated products to be isolated using oligo(dT)12-18
CC   cellulose. Note: The present sequence is not given in the specification,
CC   but is created from the inforamtion given on page 11

PT   Regulating production of a product in a cell, comprises inserting a
PT   regulatable catalytically active nucleic acid into a gene that produces
PT   the product or regulates the production of the product in the cell.
XX
PS   Example 6; Page 76; 128pp; English.
XX
CC   The present invention describes a method for regulating production of a
CC   product in a cell. The method comprises inserting a regulatable
CC   catalytically active nucleic acid (RCANA) into a gene that produces the
CC   product or regulates the production of the product in the cell, where the
CC   RCANA comprises a catalytic domain which modifies a transcript to alter
CC   its coding potential and a regulatory domain that recognises an effector
CC   that alters the function of the catalytic domain, and contacting the
CC   regulatory domain with an effector to regulate production of the product.
CC   Also described: (1) regulating a biological pathway in cell; and (2)
CC   screening a population of cells for a cell that produces a bioproduct.
CC   The methods are useful for regulating a biological pathway in cell, or
CC   regulating production of a product in a cell. The RCANAs are useful as
CC   regulatory elements to control the expression of genes in a metabolic
CC   pathway, or as regulated selectable markers to increase a selective
CC   pressure favouring or disfavouring production of a targeted bioproduct.
CC   The RCANAs are also useful for in vitro or in vivo sensing or detection,
CC   and in gene therapy. The present sequence represents an RNA substrate
CC   oligonucleotide, which is used in an example from the present invention.

PT   In vivo cDNA synthesis - by using synthetic polynucleotide(s) which bind
PT   in vivo to RNA templates as primers for reverse transcriptase.
XX
PS   Example 1; Page 33; 102pp; English.
XX
CC   DNA encoding the modified tRNA primer, tRNAPolyU (AAQ68616), was obtained
CC   using the primer pair given in AAQ68612-13. The DNA was cloned in pUC18.
CC   PCR was used to amplify a promoter-tRNA-polyU fragment and to define the
CC   end of the tRNAPolyU coding template. A reverse tRNA primer (AAQ68614)
CC   was used. The 5' base of this primer was also the last 3' base of the
CC   encoded tRNAPolyU template, as shown in AAQ68617. For in vitro production
CC   of tRNAPolyU, a DraI-sensitive T7-tRNAPolyU cassette was linearized and
CC   used as template for in vitro transcription using oligomers AAQ68612 and
CC   AAQ68515. The tRNA primer is used for in vivo cDNA synthesis. (Updated on
CC   25-MAR-2003 to correct PN field.)

CC   This sequence represents a reverse tRNA primer and is used to amplify the
CC   sequence represented by AAT09937. The amplified sequence is used in the
CC   method of the invention, along with the sequence amplified by AAT09930
CC   and AAT09931. The sequence amplified by AAT09930 and AAT09931 is a
CC   recombinant tRNAproGGG primer operatively linked to the bacteriophage T7
CC   RNA polymerase promoter which is capable of binding to the Moloney Murine
CC   Leukaemia Virus (MoMuMLV) reverse transcriptase (RT) and can then be used
CC   in the method of the invention. The method is for synthesising a
CC   covalently-linked cDNA copy of a plurality of polynucleotide template
CC   molecules. In this method, a polynucleotide template primer molecule
CC   (such as the amplified sequence) is used in a mixture with a RT enzyme or
CC   complex. The mixture is then incubated under conditions which permit the
CC   synthesis of a DNA molecule which comprises regions complementary to the
CC   polynucleotide template molecule. The primers and DNA molecules can be
CC   used in the construction of subtractive cDNA libraries, production of
CC   specific cytotoxic or light sensitive cDNA products, and cDNA probes for
CC   analytical, diagnostic or preparative use. Also, they can be used in in
CC   vivo DNA sequencing. The method of cDNA synthesis utilises structure-
CC   specific analogues to the natural target site of the RT enzyme or complex

PT   Increasing efficiency of second strand cDNA synthesis using terminal
PT   continuation model before performing further RNA amplification by RNA
PT   transcription.
XX
PS   Example 4; Page 78; 128pp; English.
XX
CC   This invention relates to a novel method for increasing the efficiency of
CC   second strand cDNA synthesis through a mechanism of terminal
CC   continuation. In the method an RNA molecule is obtained and a first
CC   primer is added that comprises a region that hybridises to a
CC   complementary region of the molecule before a second primer is added
CC   comprising at least one riboguanine at the 3' end of the primer. A first
CC   complementary nucleic acid molecule is synthesised, the RNA molecule and
CC   second primer are removed and a second complementary nucleic acid
CC   molecule is synthesised to form a second hybrid with an extension product
CC   of the third primer bound to the first complementary molecule. The method
CC   of the invention is useful for increasing the efficiency of second strand
CC   cDNA synthesis and may be used for linear amplification of genetic
CC   signals from histologically stained tissue. The present sequence
CC   represents a first strand synthesis - first primer used in the method of
CC   the invention

PT   An isolated polypeptide with aminopeptidase activity, for preparing food
PT   compositions, such as bread and cheese, with enhanced flavoring.
XX
PS   Example 5; Page 40; 94pp; English.
XX
CC   The invention relates to an isolated polypeptide with aminopeptidase
CC   activity and the gene encoding it (including sequences complimentary to
CC   the gene and which hybridise to it at high stringency), from Aspergillus
CC   niger. Also included are a nucleic acid construct comprising the above
CC   polynucleotide operably linked to one or more control sequences that
CC   direct the production of the polypeptide in a suitable expression host, a
CC   recombinant expression vector comprising the above nucleic acid
CC   construct, a recombinant host cell comprising the above construct or
CC   vector, and producing the protein comprising cultivating an above strain/
CC   recombinant host cell to produce a supernatant and/or cells comprising
CC   the polypeptide and recovering the polypeptide. The aminopeptidase is
CC   used to prepare a food composition such as dough to enhance the flavour
CC   of a baked product from the dough and for preparing a cheese to enhance
CC   the flavour. The invention provides a bacterial enzyme for protein
CC   hydrolysis i.e. with aminopeptidase activity, to produce flavouring
CC   agents, and the enzyme has been isolated and characterised, compared to a
CC   previously observed weak aminopeptidase activity which was detected in an
CC   Aspergillus niger culture filtrate but the source was never isolated or
CC   identified. The use of enzymes to produce flavouring agents from
CC   proteinaceous material is better than use of strong acids which can
CC   severely degrade the amino acids obtained. The present sequence is a
CC   reverse transcriptase (RT)-PCR primer used to investigate the intron-exon
CC   structure of the aminopeptidase gene

PT   PA153 cDNA transcribed from pancreatic tissue.
XX
PS   Example 2; Page 121; 123pp; English.
XX
CC   This invention describes novel contiguous and partially overlapping cDNA
CC   sequences and their encoded polypeptides, designated PA153, transcribed
CC   from human pancreatic tissue and which have cytostatic activity. The
CC   PA153 polynucleotides, proteins and antibodies are all useful in methods
CC   of detection. Detection of PA153 polynucleotide, antigens or anti-PA153
CC   antibodies in a sample is indicative of pancreatic disease. PA153
CC   antibodies (antagonists) can also be used in vivo for therapeutic use,
CC   e.g. treatment of pancreatic disease, tumours or metastases. Antisense
CC   PA153 polynucleotides can be used in gene therapy of pancreatic diseases.
CC   AAX78712-X78725 represent primers used in the method of the invention

PT   Polynucleotides encoding salivary proteins useful as anti-microbial
PT   agents.
XX
PS   Example 1; Col 53; 29pp; English.
XX
CC   The invention relates to a polynucleotide derived from the 4q12-4q13
CC   region of human chromosome 4 and encoding a zsig63 polypeptide, a
CC   secreted salivary protein with anti-microbial activity. Due to their
CC   microbial activity, the sequences can be used in the study of microbial
CC   infections, e.g. for recombinant production of anti-microbial proteins.
CC   The sequences can be used in the treatment of tooth decay, periodontal
CC   disease, thrush, gastrointestinal disease, urinary tract infections,
CC   vaginal infections, skin infections, epithelial wounds, chronic tissue
CC   damage, acquired immunodeficiency syndrome (AIDS), cystic fibrosis, lung
CC   infections, sarcoidosis, emphysema and chronic bronchitis. This sequence
CC   represents a sequencing primer for cDNA encoding human zsig63

PT   Novel secreted salivary protein, zsig63 and polynucleotide encoding it
PT   useful for treating microbial infections, inflammatory conditions, dental
PT   caries and lung infections associated with cystic fibrosis.
XX
PS   Example 1; Page 29; 33pp; English.
XX
CC   The present invention relates to a new secreted salivary protein, zsig63.
CC   The invention is useful for detecting in a test sample, the presence of
CC   an antagonist or agonist of zsig63 protein activity. The invention is
CC   also useful as an immunogen for producing an antibody to zsig63
CC   polypeptide. zsig63-cytokine fusion proteins or antibody-cytokine fusion
CC   protein are useful for enhancing in vivo killing of target tissues.
CC   Pharmaceutical composition comprising purified zsig63 polypeptide are
CC   useful in the treatment of conditions associated with pathological
CC   microbes, including bacterial, fungal and viral infections. High
CC   expression of zsig63 in salivary gland suggests that anti-microbial
CC   polypeptides are useful for treatment of dental caries (tooth decay),
CC   periodontal disease, thrush and gastrointestinal disease. Other
CC   applications can be used in urinary tract infections, vaginal infections,
CC   prevention of infection in skin and other epithelial wounds. The
CC   polypeptides can be used to establish normal microflora and protect
CC   against pathogenic colonisation and invasion. The invention is useful
CC   when pro-inflammatory activity is desired. Applications for such pro-
CC   inflammatory activity include the treatment of chronic tissue damage,
```

```
CC   particularly in areas having a limited or damaged vascular system e.g.,
CC   damage in extremities associated with diabetes. Antagonists to zsig63
CC   polypeptides may be useful as anti-inflammatory agents. The invention is
CC   useful for the treatment of patients having incompetent immune system,
CC   such as AIDS (acquired immunodeficiency syndrome) patients or individuals
CC   that have undergone chemotherapy, radiation treatment. The invention is
CC   also useful for the treatment of lung infections associated with cystic
CC   fibrosis and its agonists or antagonists are useful for aiding digestion.
CC   The present nucleic acid sequence represents a PCR primer that was used
CC   in the methods of the invention for identification of zsig63

PT   Novel secreted salivary polypeptide, zsig63, useful as antimicrobial
PT   agent for treating microbial infection, dental carries, periodontal
PT   disease, thrush gastrointestinal disease, and for aiding digestion.
XX
PS   Example 1; Page 29; 33pp; English.
XX
CC   The invention relates to human secreted salivary polypeptide designated
CC   as zsig63 and nucleic acid molecules encoding such polypeptides. zsig63
CC   can be used in detecting agonists and antagonists of its activity, and is
CC   also useful as a host defense polypeptide, immune modulating factor,
CC   antipathogenic polypeptide, cell-cell signalling molecule, growth factor,
CC   cytokine, or as secreted extracellular matrix associated proteins with
CC   growth factor hormone activity. It is useful for treating conditions
CC   associated with pathological microbes, including bacterial, fungal and
CC   viral infections, for treating dental carries (tooth decay), periodontal
CC   disease, thrush and gastrointestinal disease, for treating urinary tract
CC   infection, vaginal infection and for preventing infection in skin and
CC   other epithelial wounds. zsig63 is useful for establishing normal
CC   microflora and protect against pathogenic colonisation and invasion, for
CC   treating chronic tissue damage e.g. damage in extremities associated with
CC   diabetes and useful as anti-inflammatory agents. It is useful as a marker
CC   of lung dysfunction, salivary gland dysfunction, or dysfunction of
CC   prostate gland. It is also therapeutically useful for aiding digestion.
CC   Polynucleotides of the invention are used in gene therapy for increasing
CC   or inhibiting zsig63 activity, for detecting abnormalities on human
CC   chromosome 4 associated with disease or other human traits and as
CC   diagnostics in forensic DNA profiling. Sequences of the invention are
CC   useful for stimulating proliferation or differentiation of cardiac
CC   myocytes, for proliferation or differentiation of adipocytes and for
CC   inhibiting chondrosarcomas, atherosclerosis, restenosis and obesity. The
CC   present sequence is a primer used in the identification of human zsig63
CC   DNA

PT   Generating mutation in gene using cells which contain defective mismatch
PT   repair gene, useful to generate genetically altered mutations with new
PT   output traits.
XX
PS   Example 5; Fig 7; 59pp; English.
XX
CC   The patent discloses a method for generating hypermutable organisms.
CC   Dominant negative alleles of human mismatch repair genes can be used to
CC   generate hypermutable cells and organisms. They increase the rate of
CC   spontaneous mutations by reducing the effectiveness of DNA repair and
CC   thereby render the cells or animals hypermutable. The method is used to
CC   produce genetically altered organisms to produce new output traits. The
CC   present sequence is a bacterial poly purine nucleotide phosphorylase
CC   (polyPNP) DNA fragment containing an out-of-frame polyA tract. This
CC   sequence is used in the exemplification of the invention

PT   Obtaining single stranded polynucleotide tags from a biological sample,
PT   for analyzing gene expression or diagnosing clinical conditions,
PT   comprises employing nicking endonucleases that cleave complementary
PT   strands.
XX
PS   Example; Page 294; 302pp; English.
XX
CC   The invention relates to a method for obtaining a single stranded
CC   polynucleotide tag from a biological sample by cleaving one of the
CC   complementary strands of a double stranded polynucleotide with a cleavage
CC   agent capable of recognising a double stranded polynucleotide comprising
CC   complementary strands and cleaving only one of the strands of the
CC   polynucleotide in the process of generating a single stranded
CC   polynucleotide tag. The method is useful for separating, analysing,
CC   quantifying or obtaining single stranded polynucleotides comprising tags
CC   originating partly, and preferably wholly from a source of DNA and/or RNA
CC   in a sample comprising biological cells. The method is particularly for
CC   analysing gene expression (expression profiling or differential gene
CC   expression), or in diagnosing clinical conditions. The present sequence
CC   is a primer used in the exemplification of the invention

PT   New oligodeoxynucleic acid molecules useful for the preparation of
PT   vaccine.
XX
PS   Example 8; Page 32; 57pp; English.
XX
CC   The present sequence is that of a thiosubstituted oligodeoxynucleic acid
CC   (ODN) molecule, ODN 24, including deoxyuridine monophosphates. The
CC   invention is based on the discovery that ODNs containing deoxyuridine
CC   residues (U-ODNs) have an immunostimulatory effect comparable to, or in
CC   many instances greater than, ODNs containing CpG motifs, producing higher
CC   numbers of specific T cells to a given antigen. The U-ODNs do not induce
CC   the systemic production of pro-inflammatory cytokines and, in contrast to
CC   CpG ODNs, are not dependent on a specific motif or a palindromic
CC   sequence. Use of a U-ODN for the preparation of a vaccine is claimed.
CC   Combining the U-ODN with an antigen strongly increases the potential of
CC   the antigen to raise the protection/immune response of a vaccinated
CC   individual. An example of the invention demonstrated the generation of a
CC   specific immune response against a melanoma-derived peptide (see
CC   ABP58360) by injection of mice with the peptide in combination with ODN

PT Novel isolated zsig63 polypeptide, member of the adhesin family, useful
PT for treating dental carries, periodontal disease, thrush,
PT gastrointestinal disease, urinary tract infections, vaginal infections,
PT skin infections.
XX
PS Example 1; Page 29; 32pp; English.
XX
CC The invention relates to an isolated zsig63 polypeptide comprising at
CC least 90% identity to an amino acid sequence which comprises domain 1 of
CC zsig63, domain 2, domain 3, mature zsig63 and full length zsig3. Also
CC included are the polynucleotide encoding zsig63, a zsig63 expression
CC vector, a cultured cell comprising the vector and expressing the protein,
CC a DNA encoding a fusion protein (comprising amino acids 1-15, 16-37, 38-
CC 126, 127-219 or 16-219 of zsig63 and an additional protein), using a
CC zsig63 reporter gene construct to identify zsig63 agonists, and producing
CC an anti-zsig63 antibody using zsig63 immunogenic peptides, Zsig63 is
CC useful for detecting in a test sample, the presence of antagonist of
CC zsig63 protein activity. Zsig63 has antimicrobial activity and since
CC exhibits high expression in salivary gland, can be used for treating
CC dental carries, periodontal disease, thrush, and gastrointestinal
CC disease, urinary tract infections, vaginal infections, skin infections
CC and other epithelial wounds. The polypeptides can be used to establish
CC normal microflora and protect against pathogenic colonization and
CC invasion. Zsig63 can also be used for providing pro-inflammatory activity
CC for treating chronic, tissue damage particularly in areas having limited
CC or damaged vascular system, e.g. in diabetes, and for treating
CC immunocompromised AIDS patients or in individuals that have undergone
CC chemotherapy, radiation treatment, for treating lung infections e.g. in
CC cystic fibrosis. Detection of zsig63 polypeptide at relatively high
CC levels in the trachea may indicate that such polypeptides may serve as a
CC marker of lung dysfunction. Zsig63 is also useful in diagnosing
CC conditions associated with salivary gland or lung dysfunction including
CC salivary gland carcinoma, Pneumocystis carinii infection, emphysema,
CC chronic bronchitis, prostate dysfunctions such as prostate
CC adenocarcinoma, aiding digestion, and as components of defined cell
CC culture media and may be used to replace serum that is commonly used in
CC culture. The DNA is useful in gene therapy applications to increase or
CC inhibit zsig63 activity, and for detecting abnormalities on human
CC chromosome 4 (e.g. 4q12-4q13, associated with dentinogenesis imperfecta,
CC and dentin dysplasia type II). Zsig63 is an adhesin family member. The
CC present sequence is a primer used to isolate and sequence nucleic acdis
CC encoding human zsig63

PT Improved polymerase thermocycling reaction for nucleic acid
PT amplification, by thermal cycling of promoter-linked nucleic acid
PT template synthesis and in vitro transcriptional amplification of nucleic
PT acid sequences.
XX
PS Example 4; Page 14; 28pp; English.
XX
CC The invention relates to an improved polymerase thermocycling reaction
CC (M1) for linear amplification of nucleic acid sequences, involves
CC denaturing a number of nucleic acid templates (I), combining the
CC denatured (I) with a promoter-containing primer (P1), a primer (P2), a
CC number of deoxynucleotide triphosphates and ribonucleotide triphosphates,
CC a reverse transcription enzyme, a DNA-dependent DNA polymerase and RNA
CC polymerase, contacting P1 with (I) to generate a number of promoter-
CC containing templates, denaturing the promoter-containing templates,
CC contacting P2 with the denatured promoter-containing templates to
CC generate a number of promoter-containing double-stranded DNA templates,
CC where the double-stranded nucleic acid templates are flanked by P1 in one
CC end and P2 in the other end of the other orientation, transcribing the
CC promoter-containing double-stranded DNA templates to form a number of
CC amplified RNA sequences, including the primer region of the promoter-
CC containing double-stranded DNA templates, contacting the amplified RNA
CC sequences with P2 to form a number of cDNAs and a number of DNA-RNA
CC hybrid templates, and denaturing the DNA-RNA hybrid templates. The method
CC is useful for improved polymerase thermocycling reaction for linear
CC amplification of nucleic acid sequences, and thus for producing mRNA
CC expression profile of a cell by M1 to generate multiple copies of the
CC mRNA. M1 is also useful for determining aberrant protein production of
CC cells in a diseased state, by generating an expression profile by the
CC above method, of cells in both normal and diseased states, comparing the
CC expression profile of the cells in the normal and diseased states,
CC determining the differences in mRNA composition of the cell(s) in the
CC diseased state, isolating the mRNA sequences of cell(s) in the diseased
CC state that differ from mRNA in cell(s) in non-diseased state, amplifying
CC the isolated mRNA by M1, and determining aberrant protein function of the
CC protein coded for by the isolated mRNA. M1 is also useful for treating a
CC cell in a diseased state caused by aberrant protein production, by
CC determining protein expression of a cell in a diseased state, determining
CC the mRNA sequence for the aberrant proteins, synthesising an antisense

```
CC   sequence of the mRNA, amplifying the antisense mRNA sequences by M1, and
CC   delivering a pharmaceutically effective dosage of a composition
CC   comprising the anti-sense mRNA and a compatible lipid based biological
CC   carrier. M1 is also useful for predicting the efficacy of a proposed drug
CC   targeted against an aberrant protein, by determining aberrant protein
CC   production of cell in a diseased state by the above method, amplifying
CC   the aberrant protein by M1 and using recombinant techniques to determine
CC   the effect of proposed drug on the aberrant protein. M1 is also useful
CC   for differential screening of tissue-specific gene expression at a
CC   cellular level, for preparing labeled RNA/DNA probes for a gene chip
CC   technology, and for determining the efficacy of a drug regiment against a
CC   gene or its cDNAs. The present sequence is an Oligo (dT) primer used to
CC   produce second strand cDNA in the method of the invention

PT   Preparation of normalised, subdivided cDNA libraries from mRNA - by
PT   reverse transcription and amplification, used to screen for new genes and
PT   interacting proteins, potential drugs, and for diagnosis.
XX
PS   Example 1; Page 29; 71pp; English.
XX
CC   The invention relates to preparation of a normalised, subdivided library
CC   of amplified cDNA from the coding regions of mRNA in a sample. The method
CC   involves reverse transcription, with at least one cDNA primer of formula
CC   5'-Con1-dTn2-Vn3-Nn4 to form first stand cDNA where Con1 = any sequence
CC   of 1-100 nucleotides; dT = deoxythymidinyl; n2 is at least 1; n3 and n4
CC   are both 0, or n3 is 1 and n4 is at least 1; followed by second strand
CC   cDNA synthesis using the first strand as template and a second cDNA
CC   primer of a similar formula, in the presence of DNA polymerase I (or its
CC   Klenow fragment) and amplification of double-stranded cDNA with a set of
CC   amplification primers. Comparison of cDNA in the prepared library with a
CC   database (a computer-generated list of molecular weights of restricted
CC   DNA fragments of known sequence) is used to determine presence of an
CC   expressed protein in a cell, also to detect changes in such expression
CC   (particularly for diagnosis of disease). Surfaces (chip) having amplified
CC   cDNA stably immobilised on it, obtained by a similar method, are used to
CC   screen for genes of a particular family, by hybridisation with nucleic
CC   acid from the family (to identify new genes) and to detect differences in
CC   expression patterns between cells. The polypeptides expressed by the
CC   libraries can be used for drug development. Sequences AAV71935 to
CC   AAV71946 represent primers used to exemplify the method of the invention

PT   Transgenic mammal or its embryo useful as model for human disease, has
PT   heterologous nucleotide sequence coding for stratum corneum chymotryptic
PT   enzyme operably linked to promoter that drives its expression in skin.
XX
PS   Example 6; Page 36; 74pp; English.
XX
CC   This invention describes a novel non-human transgenic mammal or mammalian
CC   embryo having integrated within its genome, a heterologous nucleotide
CC   sequence comprising at least a significant part of a nucleotide sequence
CC   coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant,
CC   operably linked to a promoter that drives expression of heterologous scce
CC   or its variant in skin. The product of the invention is useful as a model
CC   for the study of disease with the aim of improving treatment, to relieve
CC   or ameliorate a pathogenic condition, for development or testing of a
CC   cosmetic or a pharmaceutical formulation, and for the development of a
CC   diagnostic method. It can also be used as a model for a skin disease or
CC   skin cancer. The invention is also useful for screening or identifying a
CC   compound or composition effective for the prevention or treatment of an
CC   abnormal or unwanted phenotype, and for screening or identifying a
CC   compound or composition effective for the prevention or treatment of
CC   inflammatory skin diseases selected from diseases consisting of epidermal
CC   hyperkeratosis, acanthosis, epidermal inflammation, dermal inflammation,
CC   pruritus, atopic dermatitis, eczema, acne and inherited skin diseases
CC   with epidermal hyperkeratosis. The mammal of the invention is also useful
CC   as a model for further studies of itch mechanisms and the testing of
CC   potential compounds and compositions for relieve of various skin diseases
CC   where itch is a component. This sequence represents a 5' RACE cDNA
CC   synthesis primer used in a method of detecting homologues to human
CC   stratum corneum chymotryptic enzyme, SCCE, gene. SCCE is a serine
CC   protease synonymous with human kallikrein 7 (KLK7) and is used in the
CC   development of the transgenic mammals described in the invention

PT   Detecting specific interactions between molecular targets and probes,
PT   useful for determining genotypic and physiological status of cells, by
PT   attaching an markable adapter to the target.
XX
PS   Example 1; Page 8; 25pp; German.
XX
CC   This invention describes a novel method for detecting the specific
CC   interaction between a target sequence, especially a nucleic acid, and a
CC   probe on an array, in which adapter molecules are fixed to the target,
CC   forming a continuous sequence. Labelling of the target is independently
CC   mediated by interaction of the adapter molecule with a label. The method
CC   is used to investigate the genotypic and physiological status of cells,
CC   e.g. to detect chromosomal resistance genes in Staphylococcus aureus. The
CC   method provides a modular, specific and sensitive system for quantitative
CC   or qualitative detection of a specific target. It provides efficient,
CC   homogeneous and parallel labeling of a target, before, during or after
CC   interaction with the probe array, and both DNA and RNA can be labeled.
CC   The detection signal may be amplified and only low concentrations of
CC   label (particularly 0.1-1 micro M) are used, so non-specific signals are
CC   minimised. This sequence represents a polyA adapter used in the method
CC   described in the invention

PT   Mammaglobin, secreted protein overexpressed in breast cancer.
XX
PS   Example 2; Page 55; 60pp; English.
XX
CC   The present primer was used to reverse transcribe RNA encoding a human
CC   mammary-specific protein, designated mammaglobin. The specification
CC   describes a protein comprising a mammaglobin antigen that is recognized
CC   by B and/or Tc cells specific for the natural, secreted and glycosylated
CC   form of mammaglobin polypeptide. This protein, or recombinant vectors
CC   that express it, are used in vaccines for treating mammaglobin-
CC   expressing cancers, specifically of the breast. Such cancers can also be
CC   treated using autologous tumor lymphocytes activated ex vivo with an
CC   mammaglobin antigen, then returned to the patient. Expression of
CC   mammaglobin is elevated in 27% of stage I primary breast cancers, so it
CC   represents a marker useful for diagnosis of this disease

PT   Vaccinating against tumors, infectious diseases, allergies and asthma
PT   using immunostimulatory Py-rich and TG nucleic acids.
XX
PS   Claim 101; Page 56; 338pp; English.
XX
CC   The present invention relates to a method for stimulating an immune
CC   response. The method comprises administering an immunostimulatory nucleic
CC   acid to a non-rodent subject in sufficient quantity to stimulate an
CC   immune response. The present sequence is one such immunostimulatory
CC   nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
CC   (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
CC   against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
CC   and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,
CC   haemophilus, campylobacter, clostridium, Escherichia coli and/or
CC   staphylococcus), fungal antigens and/or parasitic antigens. The method is
CC   also useful for preventing cancer, asthma, infectious disease, allergy or
CC   immune deficiency. The present sequence can also be used to redirect a
CC   Th2 to a Th1 immune response and to activate immune cells. Note: the
CC   present sequence may have a phosphorothioate backbone

PT   Assessing condition e.g. athletic ability, stage of disease, presence of
PT   drugs, response to exercise, response to vaccines, therapies, nutritional
PT   states, of performance animal involves analyzing nucleic acid expression.
XX
PS   Disclosure; Page 46; 87pp; English.
XX
CC   The invention relates to a method for assessing a condition of a
CC   performance animal. The method involves determining in sample abundance
CC   of expressed target nucleic acid; transmitting digital sample signal to
CC   remote diagnostic server; processing digital sample signal at remotely
CC   located database to correlate digital signal with digital information and
CC   returning report of particular condition of animal. The method is useful
CC   for assessing a condition of a performance animal preferably human, dog
CC   or camel. The condition can be an athletic ability and a condition that
CC   enhances, hinders, impedes or does not change an expected ability of the
CC   performance animal; and also normal, pre-clinical, overt progress and/or
CC   stage of disease, undiagnosed of unclassified conditions, presence of
CC   drugs, response to exercise, response to vaccines, therapies, nutritional
CC   states and response to environmental conditions. Diseases assessed by the
CC   invention include laminitis, lameless, viral or bacterial disease,
CC   gastritis, gastric ulcers, respiratory ailments, fractures, epistaxis,
CC   musculoskeletal damage or disorders and joint diseases. The present
CC   sequence is a primer used to illustrate the method of the invention

CC   The invention relates to antisense compounds, compositions and methods
```

```
CC   for modulating the expression of transcription factor-2 gamma (TFAP2C).
CC   TFAP2C is also known as AP-2 gamma, AP2-gamma, AP-2.2, Stra2, activating
CC   enhancer-binding protein 2 gamma, oestrogen receptor factor-1 and ERF-1.
CC   The invention is useful for inhibiting the expression of TFAP2C in cells
CC   or tissues. It is useful for treating an animal having a disease or
CC   condition associated with TFAP2C, e.g., a hyperproliferative disorder
CC   such as cancer e.g. breast cancer or colon cancer and a developmental
CC   disorder. The invention is also useful for diagnostics, therapeutics,
CC   prophylaxis and as research reagents and kits. It is also used in
CC   antisense therapy. The present sequence is a PCR primer specific for
CC   human TFAP2C DNA. This sequence is used to illustrate the method of the
CC   invention

PT   Specific cleavage of RNA, useful partic. for treating viral infection,
PT   cancers, etc. - by using anti-sense oligo:nucleotide coupled to activator
PT   of 2-5A dependent RNase.
XX
PS   Example 9; Page 66; 86pp; English.
XX
CC   This sequence was used to determine whether 2-5A-antisense chimeric
CC   molecules are inhibitory to cell growth. The molecules AAQ64709, AAQ64711
CC   and AAQ64724 all lacked cytotoxicity. In the novel 2-5A-antisense
CC   oligonucleotide chimeric molecules, the antisense region targets the
CC   chimeric molecule to a particular region of RNA to be specifically
CC   cleaved and the 2',5'-linked tetraadenylate tail activates the 2-5A
CC   RNase. Typical applications are treatment of viral infections (esp. for
CC   cleavage of an RNA virus genome), cancer; leukaemia, cardiovascular
CC   disorders (e.g. restenosis after angioplasty), genetic disorders,
CC   osteoarthritis or rheumatoid arthritis. (Updated on 25-MAR-2003 to
CC   correct PN field.)

PT   Monoclonal antibody specific for PUR protein - useful for treating
PT   cancer.
XX
PS   Example; Col 33; 64pp; English.
XX
CC   The present invention describes a monoclonal antibody that specifically
```

```
CC   binds to an epitope of the PUR protein. Antibodies that bind to the PUR
CC   protein and neutralise PUR activity may be used to treat
CC   hyperproliferative diseases such as cancer. PUR antibodies may be used
CC   diagnostically to detect aberrant expression of the PUR protein and/or
CC   mutations in the PUR gene. The present sequence represents an
CC   oligonucleotide used in the cloning and sequencing of the PUR protein and
CC   its sequence element PUR repeat, in an example from the present invention

PT   Inserting a nucleic acid into a circular vector comprising joining their
PT   ends, melting, and reannealing ends at two different concentrations,
PT   useful for cloning small amounts of nucleic acids and forming genomic
PT   libraries.
XX
PS   Example 3; Page 67; 71pp; English.
XX
CC   This invention describes a novel method (M1) for inserting a nucleic acid
CC   (N1) into a circular vector (V1) comprising joining ends of N1 and V1
CC   under a first nucleic acid concentration, melting hybridized cohesive
CC   circularization ends, and reannealing the ends at a second concentration.
CC   The methods are useful for the cloning small amounts of nucleic acids and
CC   forming genomic libraries of complex populations of DNA or cDNA. The
CC   methods allow the cloning of minute amounts of nucleic acids efficiently
CC   and avoids the size selection problems of prior art systems. Larger
CC   nucleic acid fragments are just as easily cloned, allowing highly
CC   representative libraries to be made. Vector to vector ligation is avoided
CC   using the methods. AAA40351-A40366 represents primers used to illustrate
CC   the method of the invention

CC   The present invention relates to a method for stimulating an immune
CC   response. The method comprises administering an immunostimulatory nucleic
CC   acid to a non-rodent subject in sufficient quantity to stimulate an
CC   immune response. The present sequence is one such immunostimulatory
CC   nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
CC   (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
CC   against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
CC   and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,
CC   haemophilus, campylobacter, clostridium, Escherichia coli and/or
CC   staphylococcus), fungal antigens and/or parasitic antigens. The method is
CC   also useful for preventing cancer, asthma, infectious disease, allergy or
CC   immune deficiency. The present sequence can also be used to redirect a
CC   Th2 to a Th1 immune response and to activate immune cells. Note: the
CC   present sequence may have a phosphorothioate backbone

PT   Detection of multiple analytes, e.g. ligands, receptors, polynucleotides
PT   and pollutants, involves adding a combination of sensitizer reagents and
PT   reactive reagent Actuatable by a product of the sensitizer reagents.
XX
PS   Example; Page 58; 87pp; English.
XX
CC   The invention relates to the detection of multiple components in a
CC   medium, comprising combining the medium with at least two sensitiser
CC   reagents, and at least one reactive reagent activated by a product
CC   generated by the sensitiser reagents when activated; and differentially
CC   activating the sensitiser reagents. The combination of sensitiser
CC   reagents and reactive reagent(s) allows differential detection of the
CC   components. Methods of the invention may be used for the detection of
CC   ligands, receptors and polynucleotides, and also for the detection of
CC   e.g. cells, various drugs, metabolites, pesticides (e.g. polyhalogenated
CC   biphenyls, phosphate esters, thiophosphates, carbamates and
CC   polyhalogenated sulfenamides) and pollutants. Methods of the invention
CC   allow the detection of multiple analytes in a single test medium. An
CC   application of the methods of the present invention would be in the field
CC   of clinical diagnostics. The current sequence represents A24
CC   oligonucleotide for the creation of oligonucleotide coated phthalocyanine
CC   sensitiser particles (Pc-A24)

PT   Detecting presence of polynucleotide, differences between polynucleotide
PT   sequences, useful for detecting single nucleotide polymorphism and
PT   alleles of polynucleotide sequence involves use of three competitive
PT   probes.
XX
PS   Example; Page 47; 75pp; English.
XX
CC   This invention represents a method for detecting the presence of a
CC   polynucleotide sequence, differences in polynucleotide sequences or
CC   mutations in genomic DNA. The method involves contacting 3
CC   oligonucleotide probes with a sample containing a polynucleotide. The
CC   first probe hybridises to a region of the polynucleotide sequence and the
CC   second and third probes can bind a second region of the polynucleotide
CC   sequence. The second and third probes are identical except for the
CC   presence or difference of one or more nucleotides. The reaction medium is
CC   then subjected to conditions for forming substantially non-dissociative
CC   termolecular complexes, which can be at least one of, the polynucleotide
CC   sequence with the first and second probes or the polynucleotide sequence
CC   with the first and third probes. The oligonucleotide probes have labels
CC   non-covalently bound to allow for their detection upon binding. The
CC   method of the invention is useful for detecting the presence of a single
CC   nucleotide polymorphism (SNP) in a fragment of genomic DNA. The method
CC   can be used for the direct detection of nucleic acid in very small
CC   quantities without amplification. In addition, the method may be carried
CC   out with amplification of the target and reference sequences. This
CC   sequence represents an oligonucleotide probe A24 used to create dopTAR
CC   chimiluminescer sensitiser particles in the method of the invention.
CC   Binding the nucleic acid to a suspendable particle acts as a support and
CC   provides a means of segregating the bound polynucleotide target from the
CC   bulk solution

PT   Generating mRNA-cDNA hybrids for suppressing cancer-related genes, or
PT   treating or preventing microbe related genes, comprises thermocycling
PT   steps of promoter-linked double-stranded cDNA or RNA synthesis.
XX
PS   Example 5; Page 26; 53pp; English.
XX
CC   The invention relates to generating mRNA-cDNA hybrids, comprising (a)
CC   providing a solution containing a nucleic acid template, one or more
CC   primers complementary to the sense conformation of the nucleic acid
CC   template, and one or more promoter-linked primers complementary to the
CC   antisense conformation of the nucleic acid template, and with an RNA
CC   promoter, (b) treating the nucleic acid template with the one of more
CC   primers to synthesise a first cDNA strand, (c) treating the first cDNA
CC   strand with one or more promoter-linked primers to synthesise a promoter-
CC   linked double-stranded nucleic acid, (d) treating the promoter-linked
CC   double-stranded nucleic acid to synthesise amplified mRNA fragments and
CC   (e) treating the mRNA fragments with one or more primers to synthesise
CC   mRNA-cDNA hybrids by reverse transcription of the amplified mRNA
CC   fragments. The method is useful for preparing high amounts of pure and
CC   specific mRNA-cDNA hybrids for transducing biological effects of interest
CC   in vitro as well as in vivo, for inhibiting gene function in prokaryotes
CC   and eukaryotes in vivo and in vitro, for suppressing cancer-related
CC   genes, in treating or preventing microbe related genes, in studying
CC   candidate molecular pathways with systematic knock out of involved
CC   molecules, in high throughput screening of gene functions based on
CC   microarray analysis, and as a tool in studying gene function in
CC   physiological conditions. The mRNA-cDNA hybrids may be used to screen for
CC   special gene functions, for manipulating gene expression in vitro, and
CC   for designing therapy for genetic diseases in vivo. The cDNA part of a D-
CC   RNAi (DNA-RNA interference) can be modified by nucleotide analogue
CC   incorporation to increase the stability and effectiveness of transfected
CC   probe activities. The RdRp (RNA dependent RNA polymerase) enzyme may
CC   provide higher affinity of the mRNA template of a D-RNAi compared to ds-
CC   RNA due to lower binding interaction between DNA-RNA duplexes than RNA-
CC   RNA duplexes. The cDNA part of a D-RNAi provides further antisense gene
CC   knockout activity in addition to the posttranscriptional gene silencing
```

```
CC   (PTGS) mechanisms of the sense-RNA template, resulting in multiple
CC   specific gene interference effects with one probe. The present sequence
CC   is a poly(dT) PCR primer used in conjunction with oligo(dC)10N primers to
CC   reverse transcribe mRNA into first strand cDNA in the method of the
CC   invention

PT   Prevention or treatment of gastric ulcer involves administering nucleic
PT   acid.
XX
PS   Disclosure; Page 14; 45pp; English.
XX
CC   The invention relates to a method of prevention or treatment of gastric
CC   ulcer comprising administering a nucleic acid to a subject in need for
CC   treatment of gastric ulcer. A nucleic acid sample comprising
CC   oligonucleotide 2006 was administered to a mouse model by an oral route
CC   or a vehicle control. Colonisation of mice by Heliobacter pylori was
CC   assessed at time points from 1 day to 1 month after treatment. The
CC   ability of the nucleic acid to reduce H. pylori colonisation was
CC   assessed. The method is useful for preventing or treating a gastric ulcer
CC   on a subject e.g. human or non-human vertebrate animal including dog,
CC   cat, horse (equine gastric ulcer syndrome, EGUS), cow, goat, sheep, pig,
CC   rabbit, turkey, chicken, primate, rat and mouse. The method effectively
CC   treats or prevents gastric ulcers. The present sequence represents an
CC   immunostimulatory nucleic acid for the treatment of gastric ulcers

PT   Identifying a candidate polymorphic repeat within a coding sequence, for
PT   understanding or treating genetic disease, comprises detecting tandem
PT   repeats in a target coding sequence and scoring the repeats for
PT   polymorphic probability.
XX
PS   Example; Col 579; 588pp; English.
XX
CC   The invention discloses a method for identifying a candidate polymorphic
CC   repeat within a coding sequence (expressed sequence tag, EST), which
CC   comprises detecting tandem repeats in a target coding sequence, scoring
CC   the repeats for polymorphic probability and generating a dataset
CC   correlating the repeats with polymorphic probability to identify a
CC   candidate polymorphic repeat. The computational methods (polymorphic
CC   marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are
CC   useful for identifying and detecting candidate polymorphic repeats in
CC   human genes, which can be used to understand, treat or eliminate genetic
CC   diseases, predispositions or adverse drug-treatment reactions. Examples
CC   of diseases linked to nucleotide repeats are Machado-Joseph, Haw River
CC   syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis,
CC   myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and
CC   spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are
CC   the polymorphic repeats identified for a search of human ESTs

PT   New immunostimulatory nucleic acid, useful for preparing a composition
PT   for treating an allergic condition.
XX
PS   Example 1; Page 44; 115pp; English.
XX
CC   The present invention describes immunostimulatory nucleic acids of 14-100
CC   nucleotides in length comprising the formula 5' X1DCGHX2 3' (I), where X1
CC   or X2 = independently any sequence 0-10 nucleotides; D = nucleotide other
CC   than C; C = cytosine; G = guanine; H = nucleotide other than G. The
CC   immunostimulatory nucleic acid further comprises a sequence consisting of
CC   P and N positioned immediately 5' to X1 or 3' to X2 and N is a B cell
CC   neutralising sequence, where N begins with a CGG trinucleotide and is at
CC   least 10 nucleotides long and P is GC-rich palindrome containing sequence
CC   at least 10 nucleotides long. Also described: (1) a pharmaceutical
CC   composition comprising the immunostimulatory nucleic acid and a carrier;
CC   and (2) treating an allergic condition. (I) has antiallergic activity and
CC   can be used in gene therapy. (I) can be used for preparing a composition
CC   for treating a variety of immune related disorders such as cancer,
CC   infectious diseases and allergic disorders. (I) also stimulates the
CC   activation of natural killer cells and the production of type 1
CC   interferon (IFN). The present sequence represents an immunostimulatory
CC   oligonucleotide, which is used in an example from the present invention

PT   Improved polymerase thermocycling reaction for nucleic acid
PT   amplification, by thermal cycling of promoter-linked nucleic acid
PT   template synthesis and in vitro transcriptional amplification of nucleic
PT   acid sequences.
XX
PS   Example 7; Page 14; 28pp; English.
XX
CC   The invention relates to an improved polymerase thermocycling reaction
CC   (M1) for linear amplification of nucleic acid sequences, involves
CC   denaturing a number of nucleic acid templates (I), combining the
CC   denatured (I) with a promoter-containing primer (P1), a primer (P2), a
CC   number of deoxynucleotide triphosphates and ribonucleotide triphosphates,
CC   a reverse transcription enzyme, a DNA-dependent DNA polymerase and RNA
CC   polymerase, contacting P1 with (I) to generate a number of promoter-
CC   containing templates, denaturing the promoter-containing templates,
CC   contacting P2 with the denatured promoter-containing templates to
CC   generate a number of promoter-containing double-stranded DNA templates,
CC   where the double-stranded nucleic acid templates are flanked by P1 in one
CC   end and P2 in the other end of the other orientation, transcribing the
CC   promoter-containing double-stranded DNA templates to form a number of
CC   amplified RNA sequences, including the primer region of the promoter-
CC   containing double-stranded DNA templates, contacting the amplified RNA
CC   sequences with P2 to form a number of cDNAs and a number of DNA-RNA
CC   hybrid templates, and denaturing the DNA-RNA hybrid templates. The method
CC   is useful for improved polymerase thermocycling reaction for linear
CC   amplification of nucleic acid sequences, and thus for producing mRNA
CC   expression profile of a cell by M1 to generate multiple copies of the
CC   mRNA. M1 is also useful for determining aberrant protein production of
CC   cells in a diseased state, by generating an expression profile by the
CC   above method, of cells in both normal and diseased states, comparing the
CC   expression profile of the cells in the normal and diseased states,
CC   determining the differences in mRNA composition of the cell(s) in the
CC   diseased state, isolating the mRNA sequences of cell(s) in the diseased
CC   state that differ from mRNA in cell(s) in non-diseased state, amplifying
CC   the isolated mRNA by M1, and determining aberrant protein function of the
CC   protein coded for by the isolated mRNA. M1 is also useful for treating a
CC   cell in a diseased state caused by aberrant protein production, by
CC   determining protein expression of a cell in a diseased state, determining
CC   the mRNA sequence for the aberrant proteins, synthesising an antisense
CC   sequence of the mRNA, amplifying the antisense mRNA sequences by M1, and
CC   delivering a pharmaceutically effective dosage of a composition
CC   comprising the anti-sense mRNA and a compatible lipid based biological
CC   carrier. M1 is also useful for predicting the efficacy of a proposed drug
CC   targeted against an aberrant protein, by determining aberrant protein
CC   production of cell in a diseased state by the above method, amplifying
CC   the aberrant protein by M1 and using recombinant techniques to determine
```

```
CC   the effect of proposed drug on the aberrant protein. M1 is also useful
CC   for differential screening of tissue-specific gene expression at a
CC   cellular level, for preparing labeled RNA/DNA probes for a gene chip
CC   technology, and for determining the efficacy of a drug regiment against a
CC   gene or its cDNAs. The present sequence is an Oligo (dT)24 RT-(reverse
CC   transcriptase) PCR primer used to produce first strand cDNA in the method
CC   of the invention

PT   Amplification of nucleic acids, where the promoter is blocked from
PT   extension at the 3' end, useful for eliminating multiple step reactions.
XX
PS   Disclosure; Fig 2; 9pp; English.
XX
CC   The invention relates to a method of amplification of nucleic acid which
CC   comprises primer extension by reverse transcriptase and hybridising an
CC   oligonucleotide to the single stranded DNA, where the oligonucleotide is
CC   blocked from extension at the 3' end. The method is useful for
CC   amplification of nucleic acids. In the new method, a promoter is
CC   protected from degradation throughout the method. The promoter is
CC   constructed so that it does not serve as a primer for extension of a
CC   sequence that is complementary to the target sequence, i.e. it is
CC   blocked. The method can be combined with other processes to eliminate the
CC   need for multiple steps and varying reaction conditions and their
CC   associated problems. At least three otherwise separate enzymatic
CC   reactions can occur consecutively in one phase (i.e., without organic
CC   extraction and precipitation), more preferably in the same reaction
CC   vessel. Preferably, cDNA synthesis according to the new method may occur
CC   in a modified low salt buffer. The present sequence represents the poly A
CC   tract of a mRNA used to illustrate the method of the invention.

CC   The present invention describes a method for creating a collection of
CC   recombination products between two nucleotide sequences. The method
CC   comprises combining an initial set of oligonucleotides corresponding to a
CC   first nucleotide sequence with a subsequent set of oligonucleotides
CC   corresponding to a distinct nucleotide sequence and further combining the
CC   initial and subsequent sets of combination oligonucleotides having a
CC   sequence region corresponding to the initial nucleotide sequence and a
CC   sequence region corresponding to the second oligonucleotide sequence.
CC   Also described is a method of creating a collection of recombination
CC   products between two genes. The methods and compositions of the present
CC   invention are useful in the field of synthetic gene technology, and more
CC   specifically, to generating a collection of recombination products
CC   between distinct nucleotide sequences. They can also be used in
CC   assembling a library, or a population or a collection of polypeptide
CC   variants that correspond to single or multiple polynucleotide
CC   recombination products. The present sequence is used in the
CC   exemplification of the present invention.

PT   Detecting nucleic acid targets, useful e.g. for diagnosing single
PT   nucleotide polymorphisms, by extension of capture probe complementary to
PT   open circle probe.
XX
PS   Example 1; Fig 5; 66pp; English.
XX
CC   The invention is directed to novel methods of amplifying and detecting
CC   DNA using rolling circle amplification (RCA). The invention relates to
CC   detecting a target sequence (I), which involves using a capture probe
CC   (CP) that is complementary to an open circle probe and includes a
CC   cleavage site. The method comprises: attaching a capture probe (CP) to a
CC   substrate, at both ends, where the CP includes one domain complementary
CC   to an OCP (open circle probe) and a second domain that contains a
CC   cleavage site (CS), to form a device; treating CP with (I) and OCP for
CC   form a hybridisation complex (HC); treating HC with a ligase so that OCP
CC   is circularised, forming a second complex (HC2); treating CP with a
CC   cleavage agent, to cut at CS, and adding an extension enzyme (EE) and
CC   nucleotide triphosphates (NTPs) to form an extended CP, which is
CC   detected. The method is used for detecting (I) that comprises two target
CC   domains (TD1, TD2) and (I) that comprises two adjacent target domains.
CC   The method is used for detection, genotyping and/or quantification of
CC   target sequences, for research, clinical use, quality control or field
CC   testing, particularly detection of single-nucleotide polymorphisms. The
CC   method permits a high level of multiplexing, and since it provides
CC   localized product detection, with linear kinetics, is sensitive enough
CC   for direct detection and quantitation of unmodified targets. The present
CC   sequence is that of a single base extension (SBE) probe used in SNP
CC   genotyping with RCA signal amplification to demonstrate the method of the
CC   invention.

PT   Reagent for rapidly detecting or isolating target nucleic acid sequences
PT   in polynucleotide-containing sample, comprises capture component and
PT   target-specific probe linked to solid substrate.
XX
PS   Example 3; Col 17; 24pp; English.
XX
CC   The present invention describes a rapid pairing reagent (I) for the
CC   isolation or detection of a polynucleotide (PN) analyte molecule having a
CC   selected target base sequence, in a sample containing the analyte
CC   molecule and non-target polynucleotide, comprising a capture component
CC   (A) and a target-specific probe (B) linked to a solid substrate. The
CC   isolated sequences are useful for enzymatic amplification. (I) is capable
CC   of rapidly binding nucleic acids in the sample and placing them in close
CC   proximity to target probes on the reagent, thus enabling binding under
CC   low stringency. Combination of rapid capture and concentration of
CC   polynucleotides with selective targeting of analyte molecules, greatly
CC   enhances the isolation process. Non-ionic morpholino oligomers used as
CC   probes are not extended by polymerases and therefore do not interfere
CC   with amplification of target molecule. AAA39306 to AAA39316 represent
CC   oligonucleotides used in the exemplification of the present invention

XX
PS   Example 8; Page 29; 57pp; English.
XX
CC   The present sequence represents a capture probe specific for a c-myc
CC   fusion target. It is used in the method of the invention. The
CC   specification describes the use of non-nucleoside spacers to immobilise
CC   an array of capture probes on a solid support. The solid support carries
CC   an array of capture probes, each consisting of non-nucleoside spacers
CC   plus an oligonucleotide to which a nucleic acid-protein fusion or a
CC   ribosome display particle is bound. Non-nucleoside spacers prevent
CC   interaction of proteins with the support surface, ensuring efficient
CC   hybridisation between capture probes and bound nucleic acid/protein
CC   fusions, while minimising denaturation of the protein which may then
CC   adopt its native folded structure. The arrays of capture probes are used
CC   to screen for interactions between proteins and compounds (e.g. other
CC   proteins, ligands or nucleic acids), particularly to identify potential
CC   therapeutic agents, enzyme substrates or unknown proteins that interact
CC   with drugs, but also for diagnosis (detecting disease-associated
CC   proteins) and for quantifying target molecules in a sample

PT   Preparation of controlled pore glass-polytetrafluoroethylene resin
PT   chromatography membrane by heating, calendering and sintering mixture of
PT   controlled pore glass and aqueous dispersion of polytetrafluoroethylene.
XX
PS   Example 12; Col 8; 6pp; English.
XX
CC   The invention relates to a method of preparing a controlled pore glass-
CC   polytetrafluoroethylene (PTFE) resin chromatography membrane, comprising
CC   combining controlled pore glass and an aqueous dispersion of PTFE to form
CC   a paste-like mass, heating the paste-like mass at 50-70 plus oC,
CC   calendering to form a foldable sheet, and sintering the sheet to produce
CC   a rigid, porous sheet. The method prepares a controlled pore glass-PTFE
CC   resin chromatography membrane for use in various biotechnical procedures.
CC   The membrane is useful in place of controlled pore glass as a support for
CC   the synthesis, isolation, and purification of nucleic acids and for the
CC   isolation and purification of proteins. The method produces a membrane
CC   that may be used in lieu of controlled pore glass. The present sequence
CC   represents an oligonucleotide prepared on the membrane in an example
CC   which demonstrates the method of the invention

PT Composition of matter useful for multi-component analyses, comprises
PT multiple fluorophores bound to molecular scaffold at preset positions to
PT permit fluorescence energy transfer between two fluorophores.
XX
PS Disclosure; Page 43; 113pp; English.
XX
CC This sequence represents a molecular scaffold which may be used in a
CC composition of matter comprising multiple fluorophores. The fluorophores
CC are bound to the molecular scaffold at separate predetermined positions,
CC to permit fluorescence energy transfer between two fluorophores. The
CC fluorophores are characterized by maximum emission wavelength of one
CC being greater than the minimum excitation wavelength of the other. The
CC composition is useful for determining whether a preselected nucleotide
CC residue is present at a predetermined position within a nucleic acid. It
CC is also useful in multicomponent analysis including multiplex biological
CC analysis, and identifying multiple single nucleotide polymorphisms. The
CC presence of a number of given nucleotide residues is determined
CC simultaneously by the composition of the invention

PT New zalpha11 ligand polypeptides and polynucleotides, useful for
PT stimulating proliferation, activation, differentiation and/or induction
PT of inhibition of specialized cell function, or for stimulating an
PT antigenic response.
XX
PS Example 7; Col 139; 105pp; English.
XX
CC The present invention relates to the isolation of a novel cytokine,
CC zalpha11 Ligand and the polynucleotide encoding it. The invention also
CC gives the sequence for the zalpha11 receptor and the polynucleotide
CC encoding it. The zalpha11 Ligand polypeptide stimulates proliferation of
CC natural killer (NK) cells or NK cell progenitors, the activation of NK
CC cells, proliferation of T-cells, proliferation of B-cells stimulated with
CC anti-CD40 antibodies, stimulates an antigenic response in a mammal, and
CC reduces proliferation of B-cells stimulated with anti-IgM antibodies. The
CC zalpha11 Ligand polypeptide is also useful in preparing antibodies that
CC bind to zalpha11 Ligand epitopes. The zalpha11 Ligand polynucleotides can
CC be used as probes or primers to clone regions of a zalpha11 Ligand gene,
CC and in gene therapy. Zalpha11 Ligand may also be used to identify
CC inhibitors of its activity, to enhance the generation of anti-tumour
CC responses with or without the infusion of donor lymphocytes, and to
CC activate or stimulate the immune system. The present sequence represents
CC a sequencing primer used to sequence cDNA clones in the isolation of
CC human zalpha11 Ligand

PT   Novel substantially pure androgen receptor (AR) complex-associated
PT   protein which binds to AR and increases ability of AR to transactivate
PT   androgen-responsive gene, useful as drug target for treating liver
PT   cancer.
XX
PS   Example; Page 11; 26pp; English.
XX
CC   The invention relates to an androgen receptor complex-associated protein
CC   (ARCAP) sequence and the cDNA encoding it. The protein is useful for
CC   screening a compound that decreases AR-mediated (androgen receptor
CC   mediated) transactivation which involves contacting the ARCAP protein
CC   with a protein complex comprising an AR in the presence of a candidate
CC   compound, measuring the extent of binding between the polypeptide, and
CC   determining if the extent of binding is less than the extent of binding
CC   between the polypeptide and the protein complex in the absence of the
CC   candidate compound. The ARCAP DNA is useful for determining if a sample
CC   contains cancerous cells which involves providing a sample from a human
CC   patient and detecting ARCAP expression in the sample. The sequences are
CC   useful for determining whether a sample contains liver tumour cells. This
CC   sequence represents a 5'RACE PCR primer used to amplify human ARCAP DNA

XX
PT   Transcript, genetic, and especially nucleic acid sequence analysis
PT   comprises analysis of hybrid peptide products.
XX
PS   Example 11; Page 30; 48pp; English.
XX
CC   The invention relates to a method of peptide-based transcript or genetic
CC   analysis comprising: (a) providing multiple polynucleotides (I) derived
CC   from mRNAs from a biological sample, where (I) has homology to a known
CC   reference sequence (II); (b) expressing (I); and (c) assessing a physical
CC   property of the expression products to determine the sequences of (I) by
CC   comparison with the predicted properties of polypeptides encoded by (II).
CC   The method is useful for transcript or genetic analysis, especially
CC   nucleic acid analysis where the method comprises expressing polypeptides
CC   from two or more reading frames and determining the masses to create a
CC   peptide mass signature characteristic of the nucleic acid molecule. The
CC   peptide is considerably smaller than the DNA molecule that encodes it
CC   (individual amino acids averages about 110 Daltons each whereas the
CC   trinucleotides (triplets) that encode them average N Daltons each). Also,
CC   the peptides are much more diverse in composition than nucleic acids, as
CC   they are composed of combinations of 20 different amino acids instead of
CC   combinations of 4 different nucleotides, e.g., two random DNA fragments
CC   of identical composition (e.g., with 10 adenines, 10 thymines, 15
CC   guanines, and 15 cytosines) are extremely unlikely to encode peptides of
CC   identical composition. This means that whereas the two nucleic acids have
CC   identical masses and cannot be distinguished on the basis of mass, the
CC   peptides that they encode will, except in statistically very rare cases,
CC   have different masses and can be readily distinguished in the basis of
CC   mass. The present sequence represents the coding sequence of human
CC   haemoglobin alpha 2 transcript (extreme 3' end) used in an example to
CC   demonstrate the method of the invention

PT Detection and quantitation of nucleic acid using probe with label and
PT binding group - and after hybridisation treatment with RNase and capture
PT on solid phase, particularly for RNA.
XX
PS Example 2; Page 7; 13pp; German.
XX
CC The present sequence is a PCR primer for synthetic full length CAT sense
CC RNA, which was used in a novel method for the detection and quantitative
CC determination of specific oligonucleotides (ON) or polynucleotides (PN).
CC The method comprises combining a sample containing RNA or single stranded
CC DNA with a lysis/hybridisation buffer, treating the homogenised solution
CC with 1 or more probes, which are essentially complementary to the ON or
CC PN and contain at least 2 different labels, one a specific binding group
CC and the other a detectable chemical group, hybridising under stringent

```
CC   conditions, diluting the mixture and adding an agent that cleaves single
CC   stranded nucleic acid into mononucleotides or ON, transferring the
CC   mixture to a vessel or well, coated with a substance that binds at least
CC   1 label, immobilising ON and PN hybrids (modified with 2 different labels
CC   or 1 label) to the solid phase and detecting immobilised ON or PN, or the
CC   non-immobilised labelled product, directly or via an enzyme labelled
CC   antibody. The method can be used to detect specific mRNA in human, animal
CC   or plant samples. The method is easy to perform and suitable for
CC   automation, does not require preliminary RNA isolation, can be made
CC   quantitative and has a low background. (Updated on 25-MAR-2003 to correct
CC   PR field.) (Updated on 25-MAR-2003 to correct PA field.)

PT   Analyzing repeat sequences in DNA using a probe which hybridizes to
PT   adjacent repetitive and non-repetitive regions and determining hybrid
PT   melting point is useful to detect microsatellite instability such as in
PT   hereditary cancer.
XX
PS   Claim 16; Page 7; 19pp; English.
XX
CC   The present invention relates to a method for analysing a target nucleic
CC   acid consisting of repetitive and non-repetitive sequences. The method
CC   comprises hybridising a polynucleotide probe comprising a segment
CC   complementary to a non-repetitive region and a segment complementary to
CC   an adjacent repetitive region, where the second segment consists of a
CC   defined number of repeats, and determining the melting point temperature
CC   of the hybrid. The method is used to analyse microsatellites, especially
CC   microsatellite instability, particularly as a means for detecting
CC   hereditary tumours. Alternatively, the method is used to identify an
CC   individual in a population. The present sequence is a probe for
CC   Mononucleotide repeat locus BAT26, and was used to illustrate the
CC   invention

PT New oligo:nucleotide(s) forming triple helix with target nucleic acid -
PT contain purine and pyrimidine tracts in specific orientations, useful
PT therapeutically or diagnostically e.g. for inactivating HIV RNA, etc.
XX
PS Disclosure; Page 47; 101pp; English.
XX
CC The sequence is that of an oligonucleotide, I, which is able to form a
CC triple helix with a duplex nucleic acid (dsNA) contg. a target sequence
CC which comprises at least one pyrimidine tract, and at least one adjacent
CC purine tract. It is useful for therapeutic or diagnostic control of gene
CC expression, e.g. suppression of mRNA synthesis from a target gene. A
CC specified application is targetting of RNA in the HIV-1 genome. When
CC appropriately labelled it may also be used as a probe. Attachment of
CC cleavage agents caused permanent inactivation of the target by site-
CC specific cleavage. (Updated on 25-MAR-2003 to correct PN field.)

PT   Alyssum antifungal polypeptide and corresponding DNA - used in the
PT   production of transgenic plants resistant to phytopathogenic fungi.
XX
PS   Example 4; Page 66; 92pp; English.
XX
CC   Primers AAT94578-9 were used to PCR amplify the 3' end of the sequence
CC   encoding the antifungal polypeptide AlyAFP (AAW35558), by a 3' RACE
CC   (Rapid Amplification of cDNA Ends) method. This 32-mer primer anneals to
CC   the polyA tail of the sequence. The primers amplify the sequence shown in
CC   AAT94580. The polypeptide can be used to control phytopathogenic fungi,
CC   whilst the coding DNA can be used to produce transgenic plants that
CC   express the polypeptide, making them resistant to the phytopathogenic
CC   fungi

PT   Novel antifungal protein FCWP1, isolated from Fusarium culmorum, useful
PT   for controlling fungal infections in plants.
XX
PS   Example 11; SEQ ID NO 16; 27pp; English.
XX
CC   The invention relates to an isolated antifungal ribosomal protein from
CC   fusarium culmorum, FCWP1. Also included is a fusion protein between the
CC   signal peptide of the antifungal protein AlyAFP from Alyssum and FCWP1,
CC   encoded by the nucleic acid appearing as ADC87758. The FCWP1 proteins are
CC   useful for controlling fungal infections in plants, such as those caused
CC   by Alternaria (e.g. Alternaria brassicola , Alternaria solani ),
CC   Ascochyta (e.g. Ascochyta pisi ); Botrytis (e.g. Botrytis cinerea ),
CC   Cercospora (e.g. Cercospora kikuchii , Cercospora zaea-maydis ),
CC   Colletotrichum (e.g. Colletotrichum lindemuthianum ), Diplodia (e.g.
CC   Diplodia maydis ), Fusarium (e.g. Fusarium nivale , Fusarium oxysporum ,
CC   Fusarium graminearum , Fusarium culmorum , Fusarium solani , Fusarium
CC   moniliforme , Fusarium roseum ), Gaeumanomyces (e.g. Gaeumanomyces
CC   graminis f.sp. tritici), Helminthosporium (e.g. Helminthosporium turcicum
CC   , Helminthosporium carbonum , Helminthosporium maydis ), Macrophomina
CC   (e.g. Macrophomina phaseolina , Maganaporthe grisea ), Mycosphaerella
CC   (e.g. Mycosphaerella figiensis ), Nectria ( Nectria heamatococca ),
CC   Peronospora (e.g. Peronospora manshurica , Peronospora tabacina ), Phoma
CC   (e.g. Phoma betae ), Phymatotrichum (e.g. Phymatotrichum omnivorum ),
CC   Phytophthora (e.g. Phytophthora cinnamomi , Phytophthora cactorum ,
CC   Phytophthora phaseoli , Phytophthora parasitica , Phytophthora
CC   citrophthora , Phytophthora megasperma f.sp. sojae, Phytophthora
```

```
CC   infestans ), Plasmopara (e.g. Plasmopara viticola ), Podosphaera (e.g.
CC   Podosphaera leucotricha ), Puccinia (e.g. Puccinia sorghi , Puccinia
CC   striiformis , Puccinia graminis f.sp. tritici, Puccinia asparagi ,
CC   Puccinia recondita , Puccinia arachidis ), Puthium (e.g. Puthium
CC   aphanidermatum ), Pyrenophora (e.g. Pyrenophora tritici-repentens ),
CC   Pyricularia (e.g. Pyricularia oryzae ), Pythium (e.g. Pythium ultimum ),
CC   Rhizoctonia (e.g. Rhizoctonia solani , Rhizoctonia cerealis ), Scerotium
CC   (e.g. Scerotium rolfsii ), Sclerotinia (e.g. Sclerotinia sclerotiorum ),
CC   Septoria (e.g. Septoria lycopersici , Septoria glycines , Stagonospora
CC   nodorum / Phaeosphaeria nodorum , Septoria tritici ), Thielaviopsis (e.g.
CC   Thielaviopsis basicola ), Uncinula (e.g. Uncinula necator ), Venturia
CC   (e.g. Venturia inaequalis ) or Verticillium (e.g. Verticillium dahliae ,
CC   Verticillium albo-atrum ). Mutations in the proteolytic consensus
CC   sequences contained within FCWP1 provides improved stability of its
CC   antifungal activity. Also disclosed are ribosomal proteins with similar
CC   PI (>7|) and molecular weight (<20kDa) to FCWP1, which may act as
CC   antifungal proteins. The present sequence is a PCR primer used to isolate
CC   cDNA for FCWP1. Note: The sequence data for this patent did not form part
CC   of the printed specification, but was obtained in electronic format
CC   directly from USPTO at seqdata.uspto.gov/sequence.html?DocID=6573361B1.

PT   Detecting single nucleotide polymorphism involves amplifying target
PT   sequences using small primer probe that matches or mismatches to target
PT   sequence and extending primer probe which is then detected.
XX
PS   Claim 15; Page 41; 67pp; English.
XX
CC   The invention relates to detecting single nucleotide polymorphisms by
CC   contacting an allele-specific oligonucleotide primer (P1) with a target
CC   polynucleotide to form a hybridisation complex, where the target sequence
CC   is complementary to P1 at one end but the terminal nucleotide and the
CC   third nucleotide from the terminal at the other end of P1 may not be
CC   complementary. The complex is then contacted with an exonuclease
CC   deficient DNA polymerase enzyme under conditions that promote extension
CC   of P1 with the target DNA as the template, thereby forming an extended
CC   segment of P1. Oligonucleotide probes hybridising to one or more target
CC   polynucleotides distinguish between matched and mismatched 3' ends, hence
CC   the absence of sequence amplification indicates the presence of a single
CC   nucleotide mismatch. Primer sequences complementary to a sequence on an
CC   amplification target circle can be used in rolling circle amplification
CC   (RCA). The method is useful for diagnosing a disease caused by, induced
CC   by or related to a mutation in at least one gene, such as Parkinson's
CC   disease, polycystic kidney disease, Tay-Sachs disease, Huntington
CC   disease, sickle cell anaemia, haemophilia, cystic fibrosis, diabetes,
CC   obesity, cancers of the head, neck, skin, brain, oesophagus, stomach,
CC   lung, breast, colon, ovary, testis or prostate, leukaemia, lymphoma and
CC   melanoma. Sequences AAS95711-AAS95745 represent primers, targets and
CC   fluorescence decorators used in the detection of RCA products

PT   Use of a prostate cancer associated gene and biallelic markers derived
PT   from it.
XX
PS   Example 6; Page 42; 385pp; English.
XX
CC   The invention relates to a mammalian PG1 gene and protein, and a set of
CC   PG1 biallelic markers. The PG1 polynucleotide and biallelic markers are
CC   used in a hybridisation assay, a sequencing assay, or in an allele-
CC   specific amplification assay for determining the identity of a nucleotide
CC   at a PG1-related biallelic marker. The methods can be used to detect and
CC   to assess the risk of developing cancer or prostate cancer. Early-stage
CC   diagnosis of prostate cancer relies on prostate specific antigen (PSA)
CC   dosage. However, the effectiveness of this is limited due to its
CC   inability to discriminate between malignant and non-malignant affections
CC   of the organ. A need exists for both a reliable diagnostic procedure
CC   which would enable early-stage diagnosis, and for preventative and
CC   curative treatments of the disease. The PG1 gene can be used for
CC   detection of prostate cancer, and the risk of developing it in the
CC   future, and can also be used to determine therapies for the disease

PT   Identifying a candidate polymorphic repeat within a coding sequence, for
PT   understanding or treating genetic disease, comprises detecting tandem
PT   repeats in a target coding sequence and scoring the repeats for
PT   polymorphic probability.
XX
PS   Example; Col 717; 588pp; English.
XX
CC   The invention discloses a method for identifying a candidate polymorphic
CC   repeat within a coding sequence (expressed sequence tag, EST), which
CC   comprises detecting tandem repeats in a target coding sequence, scoring
CC   the repeats for polymorphic probability and generating a dataset
CC   correlating the repeats with polymorphic probability to identify a
CC   candidate polymorphic repeat. The computational methods (polymorphic
CC   marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are
CC   useful for identifying and detecting candidate polymorphic repeats in
CC   human genes, which can be used to understand, treat or eliminate genetic
CC   diseases, predispositions or adverse drug-treatment reactions. Examples
CC   of diseases linked to nucleotide repeats are Machado-Joseph, Haw River
CC   syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis,
CC   myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and
CC   spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are
CC   the polymorphic repeats identified for a search of human ESTs

PT   Selective detection of nucleic acids by amplification with labeled
PT   primers and detection with a trap probe.
XX
PS   Example 1c; Page 19; 27pp; German.
XX
CC   This invention describes a novel method for the selective detection of
CC   nucleic acids which comprises amplification of the nucleic acid with the
CC   help of labeled primers and detection with a trap probe. The methods and
CC   reagents are used for the detection of a marker primer and at least 2
CC   immobilized (or immobilizable) trap probes with the corresponding nucleic
CC   acid sequence of interest for mutation analysis. The method can be used
CC   to detect a specific sequence in a sample of one or more nucleic acids by
CC   using several sets of primers and trap probes (i.e. in an array). The
CC   methods are useful in molecular biology and diagnostic applications,
CC   especially for simultaneous detection of multi-pathogens, typing of
CC   organisms, analyzing genetic diversity and sequencing of genes or
CC   genomes. This sequence represents a primer used in the method of the
CC   invention

PT   Detecting and separating nucleic acid, useful e.g. for diagnosis,
PT   comprises reaction with nanoparticles that carry oligonucleotides
PT   complementary to parts of the target.
XX
PS   Example 18; Page 148; 404pp; English.
XX
CC   The invention relates to a method for detection of nucleic acid (I)
CC   having at least 2 portions, comprising treatment with nanoparticles that
CC   carry oligonucleotides complementary to at least 2 parts of (I), where
CC   detectable change caused by hybridisation of the oligonucleotide to (I)
CC   is observed. The method is used to detect (or to separate) specific (I),
CC   e.g. for diagnosing a wide variety of diseases, sequencing, in forensic
CC   analysis etc., and generally to detect analytes other than (I). The
CC   oligonucleotide-derivatised nanoparticles are also useful for preparing
CC   nanostructures useful, for example, as biochips, biofilters, mechanical
CC   devices, separation membranes, chemical sensors, in computers, and for
CC   drug delivery. Very stable nanoparticle-oligonucleotide conjugates can be
CC   produced, allowing their direct use (as probes) in polymerase chain
CC   reaction, i.e. they survive multiple heating/cooling cycles so do not
CC   need to be added after amplification. (I) are detected by simple colour
CC   change, without the need for special equipment, making possible rapid
CC   field testing for e.g. pathogens. AAS63374-AAS63448 represent
CC   oligonucleotide-nanoparticle probes, and related sequences, used in the
CC   method of the invention

PT   Detecting a nucleic acid useful in e.g. diagnosing genetic, bacterial or
PT   viral diseases, by contacting the nucleic acid with oligonucleotides
PT   attached to nanoparticles and having sequences complementary a portion of
PT   the nucleic acid.
XX
PS   Example 18; Page 320; 323pp; English.
XX
CC   The sequence represents an alkanethiol-modified oligonucleotide which may
CC   be coupled with colloidal gold particles (nanoparticles) and used to
CC   demonstrate the method of the invention. The invention relates to
CC   isolating or detecting a nucleic acid of interest, in a mixture of
CC   nucleic acids, by binding it to 2 or more complimentary nucleotides which
CC   have a nanoparticle attached to their 5' ends. The nanoparticles (e.g.
CC   colloidal gold) are used to both isolate and detect (e.g. by linking the
CC   particle to a fluorescent probe) the resultant complex. The methods are
CC   useful for detecting nucleic acids, natural or synthetic, and modified or
CC   unmodified. The methods may also be applied in the diagnosis of genetic,
CC   bacterial and viral diseases, in forensics, in DNA sequencing, for
CC   paternity testing, for cell line authentication, and for monitoring gene
CC   therapy. The methods are further useful in research and analytical
CC   laboratories in DNA sequencing, in the field to detect the presence of
CC   specific pathogens, for quick identification of an infection to assist in
CC   drug prescription, and in homes and health centres for inexpensive first-
CC   line screening. The methods, which are based on observing colour change
CC   with the naked eye, are cheap, fast, simple, robust (reagents are
CC   stable), do not require specialised or expensive equipment, and little or
CC   no instrumentation is required

PT   Partitioning endogenous mRNA-protein complexes in vivo, by contacting
PT   sample comprising the complex with ligand that binds to a component of
PT   the complex and separating complex by binding ligand with a binding
PT   molecule.
XX
PS   Example 6; Page 30; 49pp; English.
XX
CC   The specification describes a method for partitioning endogenous cellular
CC   mRNA-protein (mRNP) complexes. The method comprises contacting a
CC   biological sample comprising mRNP complex with ligand that specifically
CC   binds a component of mRNP complex, separating mRNP complex by binding the
CC   ligand with a molecule specific for ligand, which is attached to the
CC   solid support and then collecting the mRNP complex by removing the
CC   complex from the support. The method is useful for in vivo partitioning
CC   of cellular mRNA protein complexes in a biological sample. The method is
CC   useful for determining the ribonomic profile of a cell which has numerous
CC   uses including monitoring of tumour development, state of growth or state
CC   of development, perturbations of a biological system such as disease,
CC   drug or toxin treatment and the state of cell aging or death,
CC   distinguishing ribonomic profiles among organisms, to discriminate
CC   between transcriptional and post-transcriptional contributions to gene
CC   expression and to track the movement of RNAs through RNP complexes,
CC   including the interactions of combinations of proteins with RNAs in RNP
CC   complexes. AAH28281-AAH28316 represent sequences derived from the 3'
CC   untranslated region (UTR) of mRNA of various genes. The sequences contain
CC   target sequences for RNA-binding proteins

PT   Detecting nucleic acid, useful for diagnosis of genetic, viral or
PT   bacterial disease, comprises hybridizing nanoparticles with attached
PT   oligonucleotides to nucleic acid and detecting change brought about by
PT   hybridization.
XX
PS   Example 18; Page 162; 412pp; English.
XX
CC   The invention relates to a method of detecting a nucleic acid (NA) having
CC   at least 2 portions comprising: (a) providing nanoparticles (NP) with
CC   attached oligonucleotides (OGN), where OGN has a sequence complementary
CC   to the sequence of NA; (b) contacting NA and NP under conditions
CC   effective to allow hybridisation of OGN with NA; and (c) observing a
CC   detectable change brought about by hybridisation of OGN with NA. The
CC   method is useful for detecting a nucleic acid, separating a selected
CC   nucleic acid from others and methods of nanofabrication. Detecting
CC   analytes such as nucleic acids and proteins are useful for the diagnosis
CC   of genetic, bacterial and viral diseases. The OGN-NP conjugates that use
CC   cyclic disulphide linkers improve the sensitivity of diagnostic assays.
CC   In particular assays using OGN-NP conjugates prepared using linkers
CC   comprising a steroid residue attached to a cyclic disulphide have been
CC   found to be approximately 10 times more sensitive than assays employing
CC   conjugates prepared using alkanethiols or acyclic disulphides as the
CC   linker. The OGN-NP conjugates are stable allowing them to be used
CC   directly in PCR solutions. Therefore conjugates added as probes to a DNA
CC   target to be PCR amplified can be carried through the 30 or 40 heating
CC   cooling cycles of the PCR and are still able to detect the amplicons
CC   without opening the tubes and causing contamination. ABK64981-ABK65055

PT   Detecting nucleic acid having two portions, by providing nanoparticles
PT   having oligonucleotides attached to it, contacting nucleic acid and
PT   nanoparticles to allow hybridization, and observing detectable change.
XX
PS   Example 18; Page 436; 442pp; English.
XX
CC   The invention describes a method of detecting (M1) a nucleic acid having
CC   two portions, involving providing nanoparticles having oligonucleotides
CC   attached to it, which has a sequence complementary to sequence of two
CC   portions of nucleic acid, contacting nucleic acid and nanoparticles, to
CC   allow hybridisation of oligonucleotides with two or more portions of
CC   nucleic acid, and observing a detectable change brought about by
CC   hybridisation. (M1), nanoparticles (I), nanoparticle-oligonucleotide
CC   conjugates (II) and the aggregate probe are useful for detecting two or
CC   more nucleic acids (from a biological source) having at least two
CC   portions, such as viral RNA, bacterial or fungal DNA, a gene associated
CC   with a disease, synthetic, or structurally-modified natural or synthetic
CC   RNA or DNA, or a product of a polymerase chain reaction amplification.
CC   (II) is useful for preparing a nanoprobe conjugate for detecting an
CC   analyte, and for detecting a nucleic acid bound to an electrode surface.
CC   (I) and (II) are useful for fabrication, and for separating a selected
CC   nucleic acid having two portions from other nucleic acids. (I), (II) and
CC   the aggregate probe are useful for detecting an analyte (especially
CC   polyvalent analyte) in a sample. This sequence represents a
CC   polynucleotide used to demonstrate the method of the invention

PT   Detecting nucleic acids having 2 portions e.g. for detecting disease,
PT   comprises use of nanoparticles which have oligonucleotides attached to
PT   them that are complementary to portions of the nucleic acid sequence.
XX
PS   Example 18; Page 40; 130pp; English.
XX
CC   This invention relates to a novel method for detecting a nucleic acid
CC   having 2 portions. The method comprises providing nanoparticles having
CC   oligonucleotides attached, where the oligonucleotide on each nanoparticle
CC   has a sequence complementary to a sequence of 2 portions of nucleic acid.
CC   The nucleic acid and nanoparticle are contacted to allow hybridisation of
CC   the oligonucleotide on the nanoparticle with two or more portions of
CC   nucleic acid and observing a detectable change brought about by the
CC   hybridisation. The method of the invention is useful for separating a
CC   selected nucleic acid having 2 portions, from other nucleic acids, and
CC   for detecting nucleic acids having 2 portions. The method of the
CC   invention is useful for detecting any type of nucleic acids which may be
CC   used for diagnosis of disease and in sequencing of nucleic acids.
CC   Preferably, the method is useful for detecting nucleic acids for
CC   diagnosis and/or monitoring of viral diseases (human immunodeficiency
CC   virus, hepatitis virus, herpes virus, cytomegalovirus and Epstein-Barr
CC   virus), bacterial diseases, sexually transmitted diseases, inherited
CC   disorders, in forensics, in DNA sequencing, for paternity testing, for
CC   cell line authentication, for monitoring gene therapy, etc. This method
CC   involves detecting nucleic acids based on observing a colour change with
CC   the naked eye so is cheap, fast, simple and robust, and does not require
CC   specialised expensive equipment. The present sequence represents an
CC   oligonucleotide used to demonstrate the method of the invention

PT   Detecting nucleic acid having two portions, by providing nanoparticles
PT   having oligonucleotides attached to it, contacting nucleic acid and
PT   nanoparticles to allow hybridization, and observing detectable change.
XX
PS   Example 18; Page 167; 467pp; English.
XX
CC   The invention relates to a method of detecting a nucleic acid having two
CC   portions. The method involves providing nanoparticles having
CC   oligonucleotides attached to it which has a sequence complementary to
CC   sequence of two portions of nucleic acid, contacting nucleic acid and
CC   nanoparticles to allow hybridisation of oligonucleotides with two or more
CC   portions of nucleic acid and observing a detectable change brought about
CC   by hybridisation. The method and aggregate probes are useful for
CC   detecting two or more nucleic acids (from a biological source) having at
CC   least two portions such as viral RNA, bacterial or fungal DNA, a gene
CC   associated with a disease, synthetic or structurally modified natural or
CC   synthetic RNA or DNA, or a product of a polymerase chain reaction
CC   amplification. The invention is useful for preparing a nanoprobe
CC   conjugate for detecting an analyte and for detecting a nucleic acid bound
CC   to an electrode surface. It is also useful for fabrication and for
CC   separating a selected nucleic acid having two portions from other nucleic
CC   acids. The present sequence is an oligo used to illustrate the method of
CC   the invention

PT   Detecting nucleic acids having at least 2 portions comprises use of
PT   nanoparticles which have oligonucleotides attached to them that are
PT   complementary to portions of the nucleic acid sequence.
XX
PS   Example 18; Page 40; 130pp; English.
XX
CC   The invention relates to detecting a nucleic acid (NA) having at least 2
CC   portions, comprises providing a type of nanoparticles (NP) having
CC   attached to oligonucleotides (O) ((O) on each NP has a sequence
CC   complementary to sequence of at least 2 portions of NA), contacting NA
CC   and NP to allow hybridisation of (O) on NP with 2 or more portions of NA,
CC   and observing a detectable change brought about by hybridisation of (O)
CC   on NP with NA. The nanoparticle is useful for separating a selected
CC   nucleic acid having at least 2 portions, from other nucleic acids, and
CC   for detecting nucleic acids having at least 2 portions. The method of
CC   using NP is useful for detecting any type of nucleic acids which may be
CC   used for diagnosis of disease and in sequencing of nucleic acids.
CC   Preferably, the method is useful for detecting nucleic acids for
CC   diagnosis and/or monitoring of viral diseases (human immunodeficiency
CC   virus, hepatitis virus, herpes virus, cytomegalovirus and Epstein-Barr
CC   virus), bacterial diseases, sexually transmitted diseases, inherited
CC   disorders, in forensics, in DNA sequencing, for paternity testing, for
CC   cell line authentication and for monitoring gene therapy. The method is
CC   useful in research and analytical laboratories in DNA sequencing and in
CC   the field to detect the presence of specific pathogens. Detecting nucleic
CC   acids based on observing a colour change with the naked eye is cheap,
CC   fast, simple and robust, and do not require specialised expensive
CC   equipment. The present sequence is a fluorescein labelled oligonucleotide
CC   used to demonstrate the method of the invention

PT Detection of nucleic acid having -2 portions used to prepare biomaterials
PT and in nanofabrication methods, comprises providing nanoparticles,
PT contacting nucleic acid and nanoparticles, and observing change.
XX
PS Example 18; Page 40; 130pp; English.
XX
CC This invention relates to a novel method for detecting nucleic acids. The
CC method comprises providing nanoparticles with oligonucleotides attached
CC to them, which have a sequence complementary to a sequence of two
CC portions of nucleic acid, contacting the nucleic acid and nanoparticles
CC to allow hybridisation of the oligonucleotides with two or more portions
CC of the nucleic acid, and observing a detectable change brought about by
CC the hybridisation. The nucleic acid to be detected must have at least two
CC portions and the distances between these are chosen so that when the
CC nanoparticle-oligonucleotide conjugate binds the target sequence a
CC detectable change occurs. The method of the invention is useful for
CC detecting two or more nucleic acids (from a biological source) having at
CC least two portions, such as viral RNA, bacterial or fungal DNA, a gene
CC associated with a disease, synthetic, or structurally- modified natural
CC or synthetic RNA or DNA, or a product of a polymerase chain reaction
CC amplification. Nanoparticle-oligonucleotide conjugates of the invention
CC are useful for preparing a nanoprobe conjugate for detecting an analyte,
CC and for detecting a nucleic acid bound to an electrode surface.
CC Nanoparticles and nanoparticle conjugates of the invention are useful for

CC nanofabrication and for separating a selected nucleic acid having two
CC portions from other nucleic acids. Diagnostic assays employing
CC nanoparticle-oligonucleotide conjugates improve the sensitivity of
CC nucleic acid detection methods and can be used to detect nucleic acids
CC that are present in only small amounts in a sample. The invention also
CC provides highly desirable nanoparticle-oligonucleotide conjugates. These
CC conjugates are stable with tailored hybridisation abilities. The present
CC sequence represents an oligonucleotide used to demonstrate the method of
CC the invention

CC This invention relates to a novel method for detecting nucleic acids. The
CC method comprises providing nanoparticles with oligonucleotides attached
CC to them, which have a sequence complementary to a sequence of two
CC portions of nucleic acid, contacting the nucleic acid and nanoparticles
CC to allow hybridisation of the oligonucleotides with two or more portions
CC of the nucleic acid, and observing a detectable change brought about by
CC the hybridisation. The nucleic acid to be detected must have at least two
CC portions and the distances between these are chosen so that when the
CC nanoparticle-oligonucleotide conjugate binds the target sequence a
CC detectable change occurs. The method of the invention is useful for
CC detecting two or more nucleic acids (from a biological source) having at
CC least two portions, such as viral RNA, bacterial or fungal DNA, a gene
CC associated with a disease, synthetic, or structurally- modified natural
CC or synthetic RNA or DNA, or a product of a polymerase chain reaction
CC amplification. Nanoparticle-oligonucleotide conjugates of the invention
CC are useful for preparing a nanoprobe conjugate for detecting an analyte,
CC and for detecting a nucleic acid bound to an electrode surface.
CC Nanoparticles and nanoparticle conjugates of the invention are useful for
CC nanofabrication and for separating a selected nucleic acid having two
CC portions from other nucleic acids. Diagnostic assays employing
CC nanoparticle-oligonucleotide conjugates improve the sensitivity of
CC nucleic acid detection methods and can be used to detect nucleic acids
CC that are present in only small amounts in a sample. The invention also
CC provides highly desirable nanoparticle-oligonucleotide conjugates. These
CC conjugates are stable with tailored hybridisation abilities. The present
CC sequence represents an oligonucleotide used to demonstrate the method of
CC the invention

```
CC   The invention relates to detecting a nucleic acid (NA) having at least 2
CC   portions comprises providing a type of nanoparticles (NP. e.g. colloidal
CC   gold) having oligonucleotides (O) attached (where (O) on each NP has a
CC   sequence complementary to sequence of at least two portions of NA),
CC   contacting NA and NP to allow hybridisation of (O) on NP with 2 or more
CC   portions of NA, and observing a detectable change brought about by
CC   hybridization of (O) on NP with NA. Also included are aggregate probes,
CC   core probes, substrate having NP attached to it, a metallic or
CC   semiconductor NP having (O) attached to it, nanomaterials/nanostructures
CC   comprising nanoparticles and methods of nanofabrication utilising
CC   nanoparticles and satellite probes. The methods, probes nucleic acids,
CC   nanoparticles and oligonucleotides are useful for separating a selected
CC   nucleic acid having at least two portions, from other nucleic acids, and
CC   for detecting nucleic acids having at least two portions, for detecting
CC   NA having at least two portions. The method is useful for detecting any
CC   type of nucleic acids which may be used for diagnosis of disease and in
CC   sequencing of nucleic acids. Preferably, the method is useful for
CC   detecting nucleic acids for diagnosis and/or monitoring of viral diseases
CC   (human immunodeficiency virus, hepatitis virus, herpes virus,
CC   cytomegalovirus and Epstein-Barr virus), bacterial diseases, sexually
CC   transmitted diseases, inherited disorders, in forensics, in DNA
CC   sequencing, for paternity testing, for cell line authentication, for
CC   monitoring gene therapy, etc. The method is useful in research and
CC   analytical laboratories in DNA sequencing, in the field to detect the
CC   presence of specific pathogens, etc. Detecting nucleic acids based on
CC   observing a colour change with the naked eye is cheap, fast, simple and
CC   robust, and do not require specialised expensive equipment. The present
CC   sequence is a spacer oligonucleotide used to illustrate the method of the
CC   invention.

PT Core/shell nanoparticle for detecting target molecules, e.g. nucleic
PT acids, comprises inner metal-containing nanoparticle core, outer non-
PT alloying gold shell, and oligonucleotides attached to gold shell.
XX
PS Example 5; Page 8; 21pp; English.
XX
CC The invention relates to a core/shell nanoparticle comprising an inner
CC metal-containing nanoparticle core and an outer non-alloying gold shell
CC surrounding the nanoparticle core. Oligonucleotides may be attached to
CC the gold shell. The invention also relates to preparation of core/shell
CC nanoparticles by treating inner metal-containing nanoparticle cores
CC simultaneously with a solution containing gold salt and a solution
CC containing a reducing agent to produce a non-alloying gold shell
CC surrounding the nanoparticle cores, and isolating the core/shell
CC nanoparticles. Detection of target analytes, e.g. a nucleic acid, bound
CC to a surface comprises contacting the surface with a solution comprising
CC a core/shell nanoparticle receptor conjugate under conditions effective
CC to allow binding of nanoparticle conjugates with the bound nucleic acid,
CC subjecting the nanoparticle conjugate to an external magnetic field to
CC accelerate movement of the nanoparticle conjugate to the surface, to
CC promote binding interaction between the nanoparticle conjugate and target
CC analyte, removing any nanoparticle conjugates that have not bound with
CC the target analyte and observing a detectable change brought about by a
CC binding interaction of the target analyte with the nanoparticle
CC conjugates. The invention is used for detecting target molecules such as
CC nucleic acids, peptides and proteins. The optical properties of
CC core/shell nanoparticles form a new calorimetric channel for nanoparticle
CC -based DNA detection. This sequence represents a magneto-gold
CC nanoparticle probe used in the scope of the invention.

PT Preparation of normalised, subdivided cDNA libraries from mRNA - by
PT reverse transcription and amplification, used to screen for new genes and
PT interacting proteins, potential drugs, and for diagnosis.
XX
PS Example 1; Page 29; 71pp; English.
XX
CC The invention relates to preparation of a normalised, subdivided library
CC of amplified cDNA from the coding regions of mRNA in a sample. The method
CC involves reverse transcription, with at least one cDNA primer of formula
CC 5'-Con1-dTn2-Vn3-Nn4 to form first stand cDNA where Con1 = any sequence
CC of 1-100 nucleotides; dT = deoxythymidinyl; n2 is at least 1; n3 and n4
CC are both 0. or n3 is 1 and n4 is at least 1; followed by second strand
CC cDNA synthesis using the first strand as template and a second cDNA
CC primer of a similar formula, in the presence of DNA polymerase I (or its
CC Klenow fragment) and amplification of double-stranded cDNA with a set of
CC amplification primers. Comparison of cDNA in the prepared library with a
CC database (a computer-generated list of molecular weights of restricted
CC DNA fragments of known sequence) is used to determine presence of an
CC expressed protein in a cell, also to detect changes in such expression
CC (particularly for diagnosis of disease). Surfaces (chip) having amplified
CC cDNA stably immobilised on it, obtained by a similar method, are used to
CC screen for genes of a particular family, by hybridisation with nucleic
CC acid from the family (to identify new genes) and to detect differences in
CC expression patterns between cells. The polypeptides expressed by the
CC libraries can be used for drug development. Sequences AAV71935 to
CC AAV71946 represent primers used to exemplify the method of the invention

PT   Detecting specific interactions between molecular targets and probes,
PT   useful for determining genotypic and physiological status of cells, by
PT   attaching an markable adapter to the target.
XX
PS   Example 1; Page 8; 25pp; German.
XX
CC   This invention describes a novel method for detecting the specific
CC   interaction between a target sequence, especially a nucleic acid, and a
CC   probe on an array, in which adapter molecules are fixed to the target,
CC   forming a continuous sequence. Labelling of the target is independently
CC   mediated by interaction of the adapter molecule with a label. The method
CC   is used to investigate the genotypic and physiological status of cells,
CC   e.g. to detect chromosomal resistance genes in Staphylococcus aureus. The
CC   method provides a modular, specific and sensitive system for quantitative
CC   or qualitative detection of a specific target. It provides efficient,
CC   homogeneous and parallel labeling of a target, before, during or after
CC   interaction with the probe array, and both DNA and RNA can be labeled.
CC   The detection signal may be amplified and only low concentrations of
CC   label (particularly 0.1-1 micro M) are used, so non-specific signals are
CC   minimised. This sequence represents a polyA adapter used in the method
CC   described in the invention

PT   New nucleic acid implicated e.g. in tumor suppression, useful for
PT   diagnosis of tumors, viral infection and cellular degeneration and for
PT   drug screening.
XX
PS   Claim 1; Page 323; 623pp; French.
XX
CC   The present invention relates to novel human nucleic acid sequences (I).
CC   The present sequence is one such nucleic acid sequence. Expression of (I)
CC   are implicated in tumour suppression or reversion and apoptosis and viral
CC   resistance. (I) are useful as probes or primers for detecting,
CC   identifying, measuring and/or amplifying nucleic acid sequences, as
CC   antisense reagents and for recombinant production of polypeptides. (I),
CC   polypeptides (II) encoded by (I), vector containing (I), cells containing
CC   these vectors and antibodies (Ab) against (II) are all useful for
CC   treatment/prevention of viral, tumour and cell degeneration diseases
CC   (especially neurodegeneration, such as Alzheimer's disease and
CC   schizophrenia). Analysing the expression of (I) is also useful for
CC   diagnosis and/or prognosis of such diseases. Transgenic animals carrying
CC   (I) are used for studying the aetiology of these diseases (also immune
CC   and inflammatory diseases). Note: In the present specification, SEQ ID 1
CC   to 2280 are claimed in Claim 1, however only SEQ ID 1 to 2270 are shown
CC   in the specification

PT   Identifying and characterizing gene expression in samples, for
PT   identifying mRNAs expressed at different levels, comprises employing an
PT   identimer having a oligo-dT primer of a specific sequence and a
PT   detectable marker at its 5' end.
XX
PS   Disclosure; Page 11; 45pp; English.
XX
CC   The invention relates to systems for identification and characterisation
CC   of gene expression in one or more samples, comprising an identimer having
CC   a specific oligo-dT primer sequence, where the identimer comprises a
CC   detectable marker at its 5' end. The system is useful for identifying any
CC   or all genes expressed in a given in vivo or in vitro RNA sample, as well
CC   as the relative differences in mRNA between 2 or more samples, where
CC   desired, for supporting discovery of new genes, and for identifying mRNAs
CC   that are expressed at different levels between 2 or more samples. The new
CC   system or method addresses limitations of prior methods by comprising
CC   compositions and systems that incorporate new strategies where molecular
CC   or biochemical assay compositions and systems are linked to DNA or RNA
CC   sequence databases for optimal resource efficiency in assaying gene
CC   expression. The system has the following advantages over existing
CC   methods: (a) prior sequence information or clone library construction is
CC   not needed to enable the assay; (b) provides immediate sequence
CC   information in addition to information concerning changes or differences
CC   in mRNA level, to determine mRNA expression level and mRNA identification
CC   in one assay; (c) generates cDNA fragments from all mRNAs present in the
CC   sample for subsequent investigation by common molecular biology
CC   techniques; and (d) does not require prior knowledge of the sequence of
CC   the genome of the organism under investigation and can be employed in
CC   organisms lacking significant genomic sequence in formation. The present
CC   sequence represents an oligo dT primer used in the method of the
CC   invention

PT   Producing encapsidated RNA virus by coexpressing RNA virus genomic
PT   sequence linked to bacteriophage promoter, and coding sequence for
PT   bacteriophage polymerase linked to poxvirus promoter in eukaryotic cell
PT   cytoplasm.
XX
PS   Disclosure; Page 38; 49pp; English.
XX
CC   The patent discloses methods to produce RNA viral sequences, recombinant
CC   RNA viruses, mutants of RNA viruses and RNA virus-derived vectors in cell
CC   culture and in vitro using non-viable, replication defective helper
CC   vaccinia recombinants. These methods generate RNA viral genomes and viral
CC   particles in cell culture and in vitro independent of their natural
CC   replication pathways, bypassing the limitation of any cellular barriers.
CC   The invention also relates to a method for producing encapsidated RNA
CC   virus comprising coexpressing polypeptide coding sequences capable of
CC   forming capsid and packaging RNA viral genomic sequence in eukaryotic
CC   cell, a construct comprising RNA viral genomic sequence linked to
CC   bacteriophage promoter and transcription terminator and bacteriophage
CC   polymerase coding sequence, which is operably compatible with the
```

```
CC   promoter and is linked to poxvirus promoter. The methods are useful for
CC   producing infectious or non-infectious, replication-defective,
CC   encapsidated RNA viruses such as hepatitis virus comprising an RNA genome
CC   e.g. hepatitis C virus (HCV), immature hepatitis B virus or hepatitis A
CC   virus, lentivirus, rhinovirus, influenza virus, LCMV, arenavirus,
CC   parainfluenza virus, reovirus, rotavirus, astrovirus, filovirus, or
CC   coronavirus. They are preferably useful for producing encapsidated human
CC   immunodeficiency virus (HIV)-1, where the HIV-1 lacks a Rev-response
CC   element (RRE) or an envelope sequence. Methods of the invention are also
CC   useful for producing replication defective gene transfer and gene therapy
CC   vectors, particularly to transfer nucleic acids to human cells in vivo
CC   and in vitro. The methods can be used for packaging therapeutic sequences
CC   as gene therapy vector preparations that are substantially free of helper
CC   virus and used as pharmaceuticals in e.g. gene replacement therapy, or
CC   cancer therapy. The present sequence is an oligonucleotide which is
CC   related to a method for production of RNA viruses

PT   Detection and quantitation of nucleic acid using probe with label and
PT   binding group - and after hybridisation treatment with RNase and capture
PT   on solid phase, particularly for RNA.
XX
PS   Example 2; Page 7; 13pp; German.
XX
CC   The present sequence is a PCR primer for synthetic full length CAT sense
CC   RNA, which was used in a novel method for the detection and quantitative
CC   determination of specific oligonucleotides (ON) or polynucleotides (PN).
CC   The method comprises combining a sample containing RNA or single stranded
CC   DNA with a lysis/hybridisation buffer, treating the homogenised solution
CC   with 1 or more probes, which are essentially complementary to the ON or
CC   PN and contain at least 2 different labels, one a specific binding group
CC   and the other a detectable chemical group, hybridising under stringent
CC   conditions, diluting the mixture and adding an agent that cleaves single
CC   stranded nucleic acid into mononucleotides or ON, transferring the
CC   mixture to a vessel or well, coated with a substance that binds at least
CC   1 label, immobilising ON and PN hybrids (modified with 2 different labels
CC   or 1 label) to the solid phase and detecting immobilised ON or PN, or the
CC   non-immobilised labelled product, directly or via an enzyme labelled
CC   antibody. The method can be used to detect specific mRNA in human, animal
CC   or plant samples. The method is easy to perform and suitable for
CC   automation, does not require preliminary RNA isolation, can be made
CC   quantitative and has a low background. (Updated on 25-MAR-2003 to correct
CC   PR field.) (Updated on 25-MAR-2003 to correct PA field.)

PT   Determining the concentration of a target nucleic acid, useful e.g. for
PT   detecting genetic mutations, comprises using a fluorescently labeled
PT   probe in which emission is reduced by binding to the target nucleic acid.
XX
PS   Example 5; Page 21; 55pp; English.
XX
CC   The invention relates to the determination of the concentration of a
CC   nucleic acid target, using a fluorescently labeled probe which produces
CC   reduced fluorescence emission when hybridised to the target nucleic acid.
CC   The method comprises measuring the reduction in emission caused by
CC   hybridisation. The new method is particularly used to quantify target
CC   nucleic acids by a real-time polymerase chain reaction, e.g. for
CC   quantifying microbial cells in co-cultures or symbiotic systems, for
CC   detecting gene mutations or polymorphisms, and for analysing melting
CC   curves of target nucleic acids to determine a Tm value. Methods of the
CC   invention allow target nucleic acids to be quantified quickly, easily and
CC   accurately. Particularly there is no need to remove unbound probe, and no
CC   materials are introduced that inhibit amplification by Taq polymerase (so
CC   conventional PCR conditions can be used). The specificity of PCR is kept
```

CC high (amplification of primer dimers is delayed), and the limit of
CC quantitation is reduced. Complex probes are not needed, and amplification
CC can be monitored in real time. The working graph for data analysis
CC (automatically generated by a computer) has a higher correlation
CC coefficient than conventional graphs so more accurate quantitation is
CC possible. The current sequence represents a synthetic
CC deoxyribooligonucleotide that was used for investigating the base
CC selectivity of a target nucleic acid

PT Calibration of molecular array data by employing calibration probes that
PT generate signals proportional to total concentrations of labeled target
PT molecules, and molecular arrays incorporating sets of calibration probes.
XX
PS Disclosure; Page 14; 32pp; English.
XX
CC The invention relates to a method for calibrating data scanned from a
CC molecular array. The method involves employing calibration probes that
CC generate signals proportional to the total concentrations of labelled
CC target molecules to which the molecular array probes are directed over an
CC entire range of sample solutions and molecular arrays incorporating sets
CC of calibration probes. Method is useful for calibrating different types
CC of signals scanned from a molecular array, or calibrating signals scanned
CC from different molecular arrays. The present sequence is poly (A)
CC normalisation probe used in calibration of molecular array data

PT   Thrombopoietin polypeptide which specifically stimulates or increases
PT   platelet production - useful in treatment of thrombocytopenia, also
PT   related DNA and vectors.
XX
PS   Example 19; Page 127; 383pp; English.
XX
CC   AAQ99576-Q99584 represent amplification primers based on regions of the
CC   human thrombopoietin (TPO) cDNA (see AAQ99552). These sequences were used
CC   to obtain a full length TPO sequence, as AAQ99552 did not have a complete
CC   3' terminus. TPO is a humoral factor capable of promoting platelet
CC   production. The protein encoded by the full length sequence can be
CC   purified by using a gel affinity column where Mpl has been coupled to a
CC   resin. AAQ99551 and AAQ99553 also encode TPO proteins. The DNA sequences
CC   are inserted into vectors which are used to transform prokaryotic and
CC   eukaryotic host cells. Using the proteins encoded by these sequences, and
CC   derivatives of them, antibodies specifically immunoreactive with a TPO
CC   protein can be created. The antibodies, DNA sequences and vectors are
CC   used to isolate the protein sequences. The TPO proteins can then be used
CC   in the treatment of platelet disorders. These include thrombocytopenia,
CC   hypoplastic anaemia, AIDS, disseminated intravascular coagulation
CC   syndrome and thrombotic thrombocytopenia. (Updated on 25-MAR-2003 to
CC   correct PR field.)

PT New microarray, comprising a matrix of cDNA probe from a set of probes
PT immobilized to a solid surface in predetermined order, useful in the
PT prognosis of patients with clear cell renal carcinoma.
XX
PS Example 2; Page 30; 179pp; English.
XX
CC The present invention relates to a microarray comprising a matrix of at
CC least one cDNA probe from a set of probes immobilised to a solid surface
CC in a predetermined order, where a row of pixels corresponds to replicates
CC of one distinct probe from the set. The probes are complementary to
CC nucleic acid sequences that are expressed differentially in aggressive as
CC compared to non-aggressive types of clear cell renal carcinoma (CC-RCC)
CC and that hybridise to the probes under high stringency conditions. The
CC microarray is useful for the prognosis of patients with CC-RCC, wherein
CC aggressive and non-aggressive CC-RCC tumour types are characterised by
CC differential expression profiles of genes that hybridise with one or more
CC probes immobilised on the microarray. The arrays are useful for gene
CC expression profiling of tumour and normal tissues. The present sequence
CC represents an oligo-dT primer used in the examples of the present
CC invention

XX
CC   The present sequence is that of pyrene-anchored locked nucleic acid (LNA)
CC   oligo(dT) primer ON14, which was used in first-strand cDNA synthesis from
CC   eukaryotic mRNA. It includes compound '17d' at its 3' end, which is based
CC   on an LNA-type 2'-O,4'-C-methylene- beta-D-ribofuranosyl moiety. It is
CC   one of a set of such primers (see also ACC48482-85) that were used in an
CC   example from the invention to demonstrate improved reverse transcription
CC   of mRNA using pyrene-LNA anchored oligo(T) primers. The following results
CC   were observed: efficient priming on mRNAs with short poly(A) tails;
CC   efficient anchoring of the oligo(T) primer by pyrene-LNA and LNA-C/G/T
CC   units resulting in an improved T20-VN anchor primer and thus avoiding
CC   reverse transcription of long poly(A) tracts; and improved reverse
CC   transcription of eukaryotic poly(A)+RNA directly from total RNA extracts
CC   due to increased specificity. The invention relates to modified LNA units
CC   that comprise unique base groups. Desirable nucleobase and nucleosidic
CC   base substitutions can mediate universal hybridisation when incorporated
CC   into nucleic acid strands. The novel LNA compounds can be used e.g. as
CC   PCR primers, in sequencing, the synthesis of antisense oligonucleotides,
CC   and in diagnostics

PT   Assessing condition e.g. athletic ability, stage of disease, presence of
PT   drugs, response to exercise, response to vaccines, therapies, nutritional
PT   states, of performance animal involves analyzing nucleic acid expression.
XX
PS   Disclosure; Page 46; 87pp; English.
XX
CC   The invention relates to a method for assessing a condition of a
CC   performance animal. The method involves determining in sample abundance
CC   of expressed target nucleic acid; transmitting digital sample signal to
CC   remote diagnostic server; processing digital sample signal at remotely
CC   located database to correlate digital signal with digital information and
CC   returning report of particular condition of animal. The method is useful
CC   for assessing a condition of a performance animal preferably human, dog
CC   or camel. The condition can be an athletic ability and a condition that
CC   enhances, hinders, impedes or does not change an expected ability of the
CC   performance animal; and also normal, pre-clinical, overt progress and/or
CC   stage of disease, undiagnosed of unclassified conditions, presence of
CC   drugs, response to exercise, response to vaccines, therapies, nutritional
CC   states and response to environmental conditions. Diseases assessed by the
CC   invention include laminitis, lameless, viral or bacterial disease,
CC   gastritis, gastric ulcers, respiratory ailments, fractures, epistaxis,
CC   musculoskeletal damage or disorders and joint diseases. The present
CC   sequence is a primer used to illustrate the method of the invention

PT   Providing mRNA profile, by generating two independent patterns
PT   characteristic of sample mRNA population, analyzing patterns, comparing
PT   gene expression by cell types under varied conditions, and identifying
PT   genes.
XX
PS   Example 2; Page 45; 67pp; English.
XX
CC   The present invention relates to a method for providing a profile of mRNA
CC   molecules present in a sample. The method comprises generating two
CC   independent patterns characteristic of the population of mRNA molecules
CC   expressed in the sample and analysing the patterns using a combinatorial
CC   algorithm, comparing gene expression by different or same cell types
CC   under different conditions, and identifying genes having a role in
CC   various cellular processes. The method is useful for the analysis and
CC   identification of transcribed genes, and fingerprinting. The method can
CC   be used to identify genes which play a role in determining various
CC   cellular processes, including susceptibility to external factors,
CC   development, and disease. The present sequence for a PCR primer is used
CC   in the methods of the present invention

PS   Example 1; Page 15; 45pp; English.
XX
CC   The invention relates to systems for identification and characterisation
CC   of gene expression in one or more samples, comprising an identimer having
CC   a specific oligo-dT primer sequence, where the identimer comprises a
CC   detectable marker at its 5' end. The system is useful for identifying any
CC   or all genes expressed in a given in vivo or in vitro RNA sample, as well
CC   as the relative differences in mRNA between 2 or more samples, where
CC   desired, for supporting discovery of new genes, and for identifying mRNAs
CC   that are expressed at different levels between 2 or more samples. The new
CC   system or method addresses limitations of prior methods by comprising
CC   compositions and systems that incorporate new strategies where molecular
CC   or biochemical assay compositions and systems are linked to DNA or RNA
CC   sequence databases for optimal resource efficiency in assaying gene
CC   expression. The system has the following advantages over existing
CC   methods: (a) prior sequence information or clone library construction is
CC   not needed to enable the assay; (b) provides immediate sequence
CC   information in addition to information concerning changes or differences
CC   in mRNA level, to determine mRNA expression level and mRNA identification
CC   in one assay; (c) generates cDNA fragments from all mRNAs present in the
CC   sample for subsequent investigation by common molecular biology
CC   techniques; and (d) does not require prior knowledge of the sequence of
CC   the genome of the organism under investigation and can be employed in
CC   organisms lacking significant genomic sequence in formation. The present
CC   sequence represents an oligo dT primer used in the method of the
CC   invention

PT   Generating mutation in gene using cells which contain defective mismatch
PT   repair gene, useful to generate genetically altered mutations with new
PT   output traits.
XX
PS   Example 5; Fig 7; 59pp; English.
XX
CC   The patent discloses a method for generating hypermutable organisms.
CC   Dominant negative alleles of human mismatch repair genes can be used to
CC   generate hypermutable cells and organisms. They increase the rate of
CC   spontaneous mutations by reducing the effectiveness of DNA repair and
CC   thereby render the cells or animals hypermutable. The method is used to
CC   produce genetically altered organisms to produce new output traits. The
CC   present sequence is a bacterial poly purine nucleotide phosphorylase
CC   (polyPNP) DNA fragment containing an in-frame polyA tract. This sequence
CC   is used in the exemplification of the invention

PT   Composition of matter useful for multi-component analyses, comprises
PT   multiple fluorophores bound to molecular scaffold at preset positions to
PT   permit fluorescence energy transfer between two fluorophores.
XX
PS   Disclosure; Page 43; 113pp; English.
XX
CC   This sequence represents a molecular scaffold which may be used in a
CC   composition of matter comprising multiple fluorophores. The fluorophores
CC   are bound to the molecular scaffold at separate predetermined positions,
CC   to permit fluorescence energy transfer between two fluorophores. The
CC   fluorophores are characterized by maximum emission wavelength of one
CC   being greater than the minimum excitation wavelength of the other. The
CC   composition is useful for determining whether a preselected nucleotide
CC   residue is present at a predetermined position within a nucleic acid. It
CC   is also useful in multicomponent analysis including multiplex biological
CC   analysis, and identifying multiple single nucleotide polymorphisms. The
CC   presence of a number of given nucleotide residues is determined
CC   simultaneously by the composition of the invention

PT   New zalpha11 ligand polypeptides and polynucleotides, useful for
PT   stimulating proliferation, activation, differentiation and/or induction
PT   of inhibition of specialized cell function, or for stimulating an
PT   antigenic response.
XX
PS   Example 7; Col 139; 105pp; English.
XX
CC   The present invention relates to the isolation of a novel cytokine,
CC   zalpha11 Ligand and the polynucleotide encoding it. The invention also
CC   gives the sequence for the zalpha11 receptor and the polynucleotide
CC   encoding it. The zalpha11 Ligand polypeptide stimulates proliferation of
CC   natural killer (NK) cells or NK cell progenitors, the activation of NK
CC   cells, proliferation of T-cells, proliferation of B-cells stimulated with
CC   anti-CD40 antibodies, stimulates an antigenic response in a mammal, and
CC   reduces proliferation of B-cells stimulated with anti-IgM antibodies. The
CC   zalpha11 Ligand polypeptide is also useful in preparing antibodies that
CC   bind to zalpha11 Ligand epitopes. The zalpha11 Ligand polynucleotides can
CC   be used as probes or primers to clone regions of a zalpha11 Ligand gene,
CC   and in gene therapy. Zalpha11 Ligand may also be used to identify
CC   inhibitors of its activity, to enhance the generation of anti-tumour
CC   responses with or without the infusion of donor lymphocytes, and to
CC   activate or stimulate the immune system. The present sequence represents
CC   a sequencing primer used to sequence cDNA clones in the isolation of
CC   human zalpha11 Ligand

PT   A stress-responsive gene promotor.
XX
PS   Example 3; Page 10; 12pp; Japanese.
XX
CC   The present invention describes a stress responsive gene promoter
CC   isolated from Saccharomyces cerevisiae (yeast). Also described in the
CC   present invention are: (1) a promoter containing a DNA hybridising with
CC   the above DNA under a stringent condition and having stress-responsive
CC   promoter activity; (2) a gene expression cassette containing the above
CC   promoter; (3) an expression vector containing the above gene expression
CC   cassette; (4) a recombinant vector in which a gene encoding an optional
CC   polypeptide is recombined to the above expression vector; (5) a
CC   transformant containing the above recombinant vector; and (6) a method
CC   for the preparation of the above polypeptide in which the above
CC   transformant is cultured and the polypeptide is collected from the
CC   resultant culture. Saccharomyces cerevisiae is used for the brewing of
CC   beer, wine and sake and production of bread. The gene is responsive to
CC   the stresses such as oxidative stress, osmotic pressure stress and
CC   glucose starvation stress. The present sequence represents a PCR primer
CC   for the yeast DOG2 stress responsive gene, which is used in an example
CC   from the present invention

PT   Dirigent and/or pinoresinol/lariciresinol reductase proteins useful for
PT   producing optically-pure lignans.
XX
PS   Example 14; Page 56; 183pp; English.
XX
CC   The present invention relates to an isolated dirigent and/or pinoresinol
CC   /lariciresinol reductase protein from a lignan biosynthetic pathway.
CC   Dirigent and/or pinoresinol/lariciresinol reductase protein and the
CC   nucleic acids that encode it may be expressed either in vivo or in vitro
CC   to produce enzymes involved in the biosynthesis of lignans. The 78-kD
CC   dirigent protein confers stereospecificity in 8,8'-linked lignan
CC   formation and binds to and orients coniferyl alcohol-derived free
CC   radicals, which then under go stereospecific coupling to form (+)-
CC   pinoresinol. Pinoresinol/lariciresinol reductase catalyses the conversion
CC   of pinoresinol to lariciresinol and then to secoisolariciresinol. The
CC   present sequence is 3' linker PCR primer, XhoI-poly(dT) used in the
CC   cloning of Thuja plicata pinoresinol/ lariciresinol reductase cDNA

PT   Testing for the presence of polymorphisms associated with inflammatory
PT   bowel disease, using a hybridization assay.
XX
PS   Claim 1; Page 65; 463pp; English.
XX
CC   The present invention describes a method for detecting the presence of
CC   polymorphisms associated with inflammatory bowel diseases such as
CC   ulcerative colitis and Crohn's disease. The methods can be used to detect
CC   the presence of genetic polymorphisms associated with inflammatory bowel
CC   disease and correlating their occurrence with disease states. They may be
CC   used in this way for phenotypic correlations, forensics, paternity
CC   testing, medicine and genetic analysis. The present sequence is a
CC   polymorphic site described in the exemplification of the invention

PT   New DNA sequences from potato, useful for producing plants with altered
PT   properties, e.g. tolerance of flooding, also related proteins, antibodies
PT   and inhibitory sequences.
XX
PS   Example 1; Page 8; 26pp; German.
XX
CC   The invention relates to DNA sequences (I) that encode six specific plant
CC   proteins: (i) a protein (ABP60425) with mitochondrial carrier protein
CC   activity (IIa); (ii) a protein (ABP60426) with transferrin binding
CC   protein activity (IIb); (iii) a protein (ABP60427) with receptor-like
CC   protein kinase activity (IIc); (iv) a protein (ABP60428) with elongation
CC   factor EF-2 activity (IId); (v) a protein (ABP60429) with non-long
CC   terminal repeat retroelement reverse transcriptase activity (IIe); or
CC   (vi) a protein (ABP60430) with helicase activity (IIf). (I), also related
CC   sequences, derived ribozymes and antisense sequences, expression vectors,
CC   encoded proteins and antibodies against the proteins, are used to produce
CC   plants with altered properties, including tolerance of overwatering. The
CC   antibodies are also used for isolation of the proteins and in
CC   immunoassays. Also (I) or their primer or probe fragments are used to
CC   screen for terminators and constitutively, aerobically or anaerobically
CC   inducible plant promoters, specifically for use in potatoes and the
CC   sequence that encodes (IId) is used to alter the translation profile in
CC   plants. Since (I) are derived from potato, their promoters and
CC   terminators provide high level transgene expression in potato, with
CC   improved tissue specificity and inducibility, and can also be used to
CC   control endogenous genes. The present sequence is that of a PCR primer
CC   used in the first strand synthesis of cDNAs derived from Potato

PT Isolating chemically regulatable DNA sequences in plants - useful for
PT chemically controlling expression in transformed plants.
XX
PS Example 72; Col 96; 175pp; English.
XX
CC This sequence represents a primer used to isolate the tobacco
CC pathogenesis-related (PR) gene. The PR gene can be isolated using the
CC method of the invention. The method is for isolating a chemically
CC regulatable DNA promoter fragment from the 5' flanking region of a

```
CC   chemically regulatable gene in a plant tissue. The method allows
CC   isolation of sequences which will be useful for the controlled expression
CC   of genes, under the control of a non-coding regulatable sequence. This is
CC   useful in plants with a herbicide or pesticide detoxification mechanism
CC   under the control of a chemical regulator, the regulator being applied
CC   before or with the herbicide or pesticide to give optimal tolerance. The
CC   promoter fragment is useful for controlling sequences which encode traits
CC   such as height, shape, development, male or female sterility, and the
CC   ability of the plant to withstand cold, heat, salt and drought. The
CC   chemical induction of the promoter allows the regulation of production of
CC   compounds, e.g. flavours, fragrances, pigments, natural sweeteners,
CC   industrial feedstocks, antimicrobials and pharmaceuticals, by
CC   biosynthesis or metabolite conversion, whose biosynthesis is controlled
CC   by endogenous or foreign genes. The method allows control over the time
CC   and rate of gene expression either throughout the whole plant, or in
CC   localized tissues, to achieve e.g. fungal or insect resistance by for
CC   instance dusting the leaves with the chemical regulator. Controlling the
CC   developmental processes by the application of a regulating chemical in
CC   e.g. the commercial production of cultivated crops allows processes such
CC   as germination, flower formation and fruit ripening to be synchronised at
CC   a given time

PT   New altered CD40L promoter for use in the study, diagnosis and treatment
PT   of a variety of inflammatory disorders and autoimmune diseases, such as
PT   rheumatoid arthritis.
XX
PS   Example 1; Fig 3; 90pp; English.
XX
CC   The present invention describes an isolated, purified nucleic acid, which
CC   is an altered CD40 ligand (CD40L) promoter (I) for CD40 ligand, having
CC   residues 331-455 of the sequence comprising 455 nucleotides given in
CC   AAF74905 where A in the wild type sequence at position 331 (corresponding
CC   to position -125) is replaced with C. (I) has antiarthritic,
```

```
CC   antirheumatic, immunosuppressive and antiinflammatory activities, and can
CC   be used in gene therapy. (I) is useful in the study, diagnosis and
CC   treatment of inflammatory and autoimmune diseases, as well as diseases in
CC   which elevated expression of CD40L is a factor, e.g., rheumatoid
CC   arthritis. The present sequence represents a CD40L poly-A tract sequence
CC   which is used in an example from the present invention

PT   Producing protein or DNA libraries which are useful for improving
PT   existing proteins, by in vitro translating protein coding sequences to
PT   produce RNA-protein fusions and incubating these protein fusions under
PT   high salt conditions.
XX
PS   Disclosure; Page 44; 121pp; English.
XX
CC   The present sequence is one of a number of oligonucleotides which were
CC   used for the generation of RNA-protein fusions, including fusions having
CC   a myc epitope tag. The RNA-protein fusions comprise a protein covalently
CC   linked to the 3' end of its own mRNA. This is accomplished by synthesis
CC   and in vitro or in situ translation of an mRNA molecule with a peptide
CC   acceptor attached to its 3' end. The RNA-protein fusions are incubated
CC   under high salt conditions to produce a protein library. This method is
CC   useful for improving or altering existing proteins, as well as for
CC   isolating new proteins and nucleic acid or small molecule targets. It may
CC   also be used to improve human or humanised single-chain antibodies for
CC   the treatment of a number of diseases. The method is useful for the
CC   isolation of proteins with specific binding properties, for screening
CC   cDNA libraries and cloning new genes on the basis of protein-protein
CC   interactions. Unlike prior art, the new method does not rely on
CC   maintaining the integrity of an mRNA:ribosome:nascent chain ternary
CC   complex, which is very fragile and is therefore of limited use. The
CC   method does not rely on topological links between the protein and the
CC   nucleic acid so that the information of the protein is retained and can
CC   be recovered in readable, nucleic acid form

PT   Selection of specific protein by screening protein-RNA fusions generated
PT   in vitro or in situ - useful for, e.g. identifying enzymes and antibodies
PT   with altered properties, potentially useful as catalysts or for therapy
PT   or diagnosis.
XX
PS   Disclosure; Page 40; 94pp; English.
XX
CC   The Oligonucleotides AAV48087, AAV48089-V48091 and AAV48096-V48098 and
CC   variations were used to generate RNA-protein fusions. These were used in
CC   the selection of a specific protein or RNA, by in vitro or in situ
CC   translation of candidate RNA molecules to produce RNA-protein fusions,
CC   then selecting specific RNA protein fusions. The method is used to select
CC   proteins (or DNA encoding them) having altered properties, e.g. for
CC   identification of new binding reagents, to identify improved human
CC   antibodies or new enzymes. These proteins are potentially useful in
CC   diagnosis and therapy, or as industrial catalysts. The methods allow many
CC   rounds of selection and amplification to be performed, resulting in
```

```
CC   enrichment of even very rare molecules and allowing isolation of proteins
CC   that bind specifically to almost any compound or catalyse almost any
CC   reaction

PT   Novel replicase complex comprising hepatitis C virus NS5B replicase, a 3
PT   nucleotide-long template to which a 2 nucleotide-long primer is annealed,
PT   and template and primer which do not form a stable duplex in the absence
PT   of HCV NS5B.
XX
PS   Example; Page 6; 17pp; English.
XX
CC   The invention relates to a replicase complex comprising a hepatitis C
CC   virus (HCV) NS5B replicase protein, a linear nucleic acid template and a
CC   complementary nucleic acid primer which is annealed to the 3' terminus of
CC   the template, where the template is at least three nucleotides and the
CC   primer is two or three nucleotides, and the template and primer do not
CC   form a stable duplex in solution in the absence of the HCV NS5B protein.
CC   The complex is useful for detecting HCV replicase activity and permits
CC   establishment of sensitive RNA-dependent RNA polymerase assays to screen
CC   and evaluate antiviral inhibitors and to improve the specificity and
CC   efficacy of the inhibitors. The complex is also useful in the development
CC   of a reliable system for determining kinetic and thermodynamic constants
CC   of HCV NS5B-catalysed nucleotide incorporation and investigation of
CC   mechanistic inhibitors for mis-incorporation or chain termination.
CC   Specifically, the short RNA template and primer pairs are useful in
CC   screening assays which are used for determining kinetic, thermodynamic
CC   and mechanistic properties of NS5B replication and ultimately in the
CC   development of inhibitors of NS5B. Newly identified inhibitors of
CC   replicase activity may be used for developing anti-HCV pharmaceuticals.
CC   Sequences ABK99271-ABK99296 represent HCV NS5B replicase RNA synthesis
CC   templates

PT   Assay system for hepatitis C virus replicase activity comprises RNA
PT   template with unstable, small stemloop capable of forming copy-back
PT   structure, viral non-structural protein 5B, nucleoside triphosphates,
PT   buffer.
XX
PS   Example 1; Fig 1A; 10pp; English.
XX
CC   The present invention relates to an assay system for hepatitis C virus
CC   (HCV) replicase activity. The assay system comprises an RNA template that
CC   has an unstable, small stemloop at the 3' end capable of forming a copy-
CC   back structure, a HCV non-structural protein 5B (NS5B), ATP, GTP, CTP,
CC   and UTP nucleoside triphosphates (NTPs), where one of the NTP is
CC   radiolabelled and an assay buffer that supports replication activity of
CC   NS5B. The invention also relates to the identification of optimal
CC   properties of an RNA template for copy-back self-priming RNA synthesis of
CC   HCV. This activity can be used to screen for anti-HCV replicase compounds
CC   or to characterise the biological relevance of lead compounds. The
CC   optimal RNA templates can be used for developing a system to characterise
CC   HCV NS5B polymerase mechanistically and kinetically and for designing
CC   small RNA molecules to co-crystallise with HCV NS5B polymerase. The assay
CC   system of the invention is useful for detecting HCV replicase activity.
CC   The nucleic acid synthesised by NS5B is detected by evaluating an
CC   autoradiograph of reaction products separated by gel electrophoresis. The
CC   present sequence is RNA template, AU used to direct RNA synthesis by RNA
CC   polymerase proteins of HCV, BVDV and polivirus. This sequence is used in
CC   the exemplification of the invention

PT   Novel replicase complex comprising hepatitis C virus NS5B replicase, a 3
PT   nucleotide-long template to which a 2 nucleotide-long primer is annealed,
PT   and template and primer which do not form a stable duplex in the absence
PT   of HCV NS5B.
XX
PS   Example; Page 6; 17pp; English.
XX
CC   The invention relates to a replicase complex comprising a hepatitis C
CC   virus (HCV) NS5B replicase protein, a linear nucleic acid template and a
CC   complementary nucleic acid primer which is annealed to the 3' terminus of
CC   the template, where the template is at least three nucleotides and the
CC   primer is two or three nucleotides, and the template and primer do not
CC   form a stable duplex in solution in the absence of the HCV NS5B protein.
CC   The complex is useful for detecting HCV replicase activity and permits
CC   establishment of sensitive RNA-dependent RNA polymerase assays to screen
CC   and evaluate antiviral inhibitors and to improve the specificity and
CC   efficacy of the inhibitors. The complex is also useful in the development
CC   of a reliable system for determining kinetic and thermodynamic constants
CC   of HCV NS5B-catalysed nucleotide incorporation and investigation of
CC   mechanistic inhibitors for mis-incorporation or chain termination.
CC   Specifically, the short RNA template and primer pairs are useful in
CC   screening assays which are used for determining kinetic, thermodynamic
CC   and mechanistic properties of NS5B replication and ultimately in the
CC   development of inhibitors of NS5B. Newly identified inhibitors of
CC   replicase activity may be used for developing anti-HCV pharmaceuticals.
CC   Sequences ABK99271-ABK99296 represent HCV NS5B replicase RNA synthesis
CC   templates

PT   Assay system for hepatitis C virus replicase activity comprises RNA
PT   template with unstable, small stemloop capable of forming copy-back
PT   structure, viral non-structural protein 5B, nucleoside triphosphates,
PT   buffer.
XX
PS   Example 1; Fig 1A; 10pp; English.
XX
CC   The present invention relates to an assay system for hepatitis C virus
CC   (HCV) replicase activity. The assay system comprises an RNA template that
CC   has an unstable, small stemloop at the 3' end capable of forming a copy-
CC   back structure, a HCV non-structural protein 5B (NS5B), ATP, GTP, CTP,
CC   and UTP nucleoside triphosphates (NTPs), where one of the NTP is
CC   radiolabelled and an assay buffer that supports replication activity of
CC   NS5B. The invention also relates to the identification of optimal
CC   properties of an RNA template for copy-back self-priming RNA synthesis of
CC   HCV. This activity can be used to screen for anti-HCV replicase compounds
CC   or to characterise the biological relevance of lead compounds. The
CC   optimal RNA templates can be used for developing a system to characterise
CC   HCV NS5B polymerase mechanistically and kinetically and for designing
CC   small RNA molecules to co-crystallise with HCV NS5B polymerase. The assay
CC   system of the invention is useful for detecting HCV replicase activity.
CC   The nucleic acid synthesised by NS5B is detected by evaluating an
CC   autoradiograph of reaction products separated by gel electrophoresis. The
CC   present sequence is RNA template, (AU)5 used to direct RNA synthesis by
CC   RNA polymerase proteins of HCV, BVDV and polivirus. This sequence is used
CC   in the exemplification of the invention

```

```
CC   The sequence is that of a bovine microsatellite sequence obtd. by
CC   screening a library of bovine MboI DNA fragments of between 250 and 500
CC   bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50
CC   clones cross-hybridised. Assuming independent distribution of
CC   microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
CC   in the bovine genome is estimated at >100, 000. The sequence information
CC   for ca. 230 such bovine microsatellites is summarised in the
CC   specification and indexed herein (see below). The sequences upstream and
CC   downstream of the microsatellite sequence were used to generate the
CC   required PCR primers for in vitro amplification of the corresp.
CC   microsatellite (using the program OPTIPRIM). The microsatellites may be
CC   used to identify individuals, for parentage testing, and in the genetic
CC   mapping of economic trait loci, or genes involved the determinism of
CC   economically important traits esp. in cattle, to allow selective
CC   breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN
CC   field.)

PT   Assay device for hapten or its specific antibodies - comprises support
PT   having competitive reagent immobilised via nucleic acid ligand to improve
PT   orientation and accessibility.
XX
PS   Example 1; Page 10; 39pp; French.
XX
CC   Oligonucleotides (AAQ94201-Q94205) were synthesised for use as ligands.
CC   The ligands are covalently linked to a hapten (esp. a steroid hormone) to
CC   form a conjugate which is then immobilised on a solid support for
CC   interaction with antibodies against the hapten. Nucleic acid ligands are
CC   less likely to be recognised by the antibodies than are peptide ligands
CC   and nucleic acids are also less likely to undergo intramolecular
CC   organisation which interferes with accessibility of the hapten to the
CC   antibodies. For immunodiagnosis of oestradiol, the active hapten
CC   oestradiol-6-carboxymethoxime-N- hydroxysuccinimide ester was used.

PT   Sulphurisation of phosphorus-containing compounds, e.g.
PT   oligo:nucleotide(s) - by contacting the compound with a di:sulphide-
PT   containing five-membered heterocycle.
XX
PS   Example 7; Page 30; 51pp; English.
XX
CC   The present invention provides a method for sulphurising phosphorus-
CC   containing compounds. It comprises contacting the phosphorus-containing
CC   compound which a 1,2,4-dithiazolidine-2,5-dione compound or a 3-
CC   substituted-1,2,4-dithiazolin-5-one compound. The method is especially
CC   useful for incorporation of phosphorothioate linkages into biologically
CC   important molecules such as DNA, RNA and phosphopeptides. Molecules
CC   containing such linkages are useful e.g. as antisense compounds for
CC   inhibiting gene expression, as reagents for studying DNA-protein or RNA-
CC   protein interactions, or as catalytic RNA. The present sequence
CC   represents an oligonucleotide with phosphorothioate linkages prepared by
CC   the method of the invention

PT   Mycobacterium vaccae polypeptides - used to develop products for use in
PT   detection, therapy and prevention of mycobacteria infections or as immune
PT   response enhancers.
XX
PS   Example 8; Page 99; 153pp; English.
XX
CC   This oligonucleotide is used in the DNA cloning strategies of the
CC   Mycobacterium vaccae antigens. The invention provides M. vaccae
CC   polypeptides that comprise an immunogenic portion of a soluble M. vaccae
CC   antigen, or a variant, where the antigen induces an immune response in
CC   patients previously exposed to a mycobacterium. Such M. vaccae
CC   polypeptides can be used in methods for enhancing non-specific immune
CC   response. The methods and products can be used for the detection,
CC   treatment and prevention of infectious diseases caused by mycobacteria
CC   such as M. vaccae, M. avium or M. tuberculosis. The products also have
CC   the ability to induce cell proliferation and cytokine production (e.g.
CC   interferon-gamma and interleukin-12 production) in T cells, NK cells, B
CC   cells, or macrophages. They can be used for enhancing immune responses
CC   for use in vaccines or immunotherapy of infectious diseases and cancers

PT   Separation of electrically charged target molecules - by capillary
PT   affinity gel electrophoresis using polymer-gel to which receptors for
PT   target molecules are bound.
XX
PS   Example D3; Page 25; 41pp; English.
XX
CC   A mixture of oligonucleotides (AAT86604-7) were separated by a new
CC   process using capillary affinity gel electrophoresis. The invention
CC   relates to selective separation of electrically charged target molecules
CC   in an analytical mixture. It comprises capillary affinity gel
CC   electrophoresis using a capillary tube which is at least partly filled
CC   with a polymer gel. Receptors for target molecules are covalently bound
CC   to the polymer. An electric field of at least 50 volts/cm is applied. The
CC   capillary tube is charged with the analytical mixture. In a first
CC   separation stage, the target molecules in the mixture are bound to the
CC   receptors and the remaining components are eluted, optionally whilst
CC   splitting open. In a second stage, the elution conditions are changed,
CC   optionally in stages, so that the affinity of the target molecules for
CC   the receptor is eliminated and the target molecules are eluted and
CC   detected, optionally whilst splitting open. The process is useful for
CC   selective separation and/or determination of charged organic compounds,
CC   such as oligonucleotides, peptides or carbohydrates. It may be used, e.g.
CC   for isolation of specific proteins and DNA molecules, purification of
CC   antibodies, analysis of antisense compounds or screening for enzyme
CC   inhibitors. The process achieves higher resolution and selectivity than
CC   prior art processes, especially in the case of complex biological
CC   analytical mixtures. It has high sensitivity, even with small amounts of
CC   samples. The derivatised polymers may be synthesised specifically using
CC   standard methods

PT 2-Silyloxymethyl ribonucleosides and their phosphonate derivatives - have
PT high purity, use in machine synthesis of ribonucleic acids, enable longer
PT oligonucleotide chain construction, and larger amounts.
XX
PS Example 6; Page 25; 38pp; English.
XX
CC The invention relates to silyloxymethyl protected D- or L-ribonucleosides
CC and their phosphonates (I), and silyloxymethyl halides (II). (I) are
CC intermediates for synthesis of RNA-oligonucleotides with predetermined
CC nucleotide sequence, particularly by machine synthesis. The groups
CC specified above, apart from those on silyl, are those particularly for
CC the cyanoethyl phosphoramidate coupling. Uses of the oligoribonucleotide
CC products in diagnosis, therapy, and as research tools, are well known,
CC and are not dealt with in detail. (II) is an intermediate for (I). The
CC silyloxymethyl halide reagent is easy to prepare, and yields are high.
CC Introduction of the silyloxymethyl group into the ribonucleoside is
CC simple and rapid, and the acetal bond formed does not migrate,
CC eliminating particularly the prior art problem of 2' to 3' isomerisation.
CC The methylenedioxy group spacer between the silyl group and nucleoside
CC ring results in less steric hindrance than bulky direct silyloxy
CC linkages, enabling first, a range of choices for the silyl substituents,
CC to provide, e.g., acid or base stability; and second, higher yields in
CC coupling. Purer products are therefore obtained than in prior art,
CC enabling larger quantities and longer chains of oligoribonucleotides to
CC be synthesised successfully, and in shorter times

PT Quantitative analysis of a biochemical compound such as glucose, in body
PT a body fluid such as blood, comprising detecting enhanced electron
PT transfer between an oxidase and a DNA-immobilized electrode, useful for
PT diagnosis of disease.
XX
PS Example 1; Page 7; 14pp; English.
XX
CC This invention describes a novel method for quantitatively analysing a
CC biochemical compound (I) which comprises contacting (I) with double
CC stranded DNA fixed to the surface of an electrode at their terminals in
CC which electrochemically active threading intercalators are intercalated,
CC in an aqueous medium under application of electric potential to the
CC electrode in the presence of an oxidase which oxidizes the biochemical
CC compound and becomes reduced, and detecting electric current flowing
CC between the electrode and a second electrode in the aqueous medium. The
CC method is useful for detection of biochemical compounds such as glucose,
CC cholesterol, urea nitrogen, bilirubin, uric acid, haemoglobin and lactic
CC acid in body fluids such as whole blood, plasma, serum, urine, and lymph
CC for diagnosis of various diseases. The method allows detection of
CC biochemical compounds quickly and easily with a high sensitivity using a
CC simple apparatus. This sequence represents DNA fragment used as fixed
CC probe DNA in the method of the invention

PT Saturated and unsaturated derivatives of abietic acid and their
PT conjugated derivatives with natural and synthetic polymers, having use in
PT diagnostics, chemical reactions and analysis.
XX
PS Example 5; Page 20; 39pp; French.
XX
CC The invention relates to novel saturated and unsaturated abietane
CC derivatives. The new compounds may be used directly or indirectly in the

```
CC   development of new diagnostic tests, to follow infections, especially
CC   viral infections, to follow and/or measure chemical products, especially
CC   potential pollutants. In diagnostic tests they may be used as markers, or
CC   to form a universal solid phase after immobilization on a solid support,
CC   to produce monoclonal antibodies or polyclonal antibodies having
CC   diagnostic uses. The oligonucleotides AAZ91113-Z91117 represent examples
CC   of sequences that can be labeled with the new abietane derivatives. The
CC   new derivatives may be used to substitute for biotin in diagnostic tests,
CC   but because they are not found naturally in humans the risk of potential
CC   interactions with biological molecules is eliminated

PT   Preparation of mixed backbone oligomeric compounds useful as e.g. primers
PT   for diagnostic tests, involves oxidation of H-phosphonate internucleoside
PT   linkages to phosphodiester internucleoside linkages.
XX
PS   Example 12; Page 34; 49pp; English.
XX
CC   The present sequence is that of a phosphodiester oligonucleotide
CC   containing 20 T nucleobases, 19 having a 2'-methoxyethoxy group on its 5'
CC   ribosyl sugar moiety. It is an example of an oligomeric compound produced
CC   according to the methods of the invention. The invention provides
CC   compounds and methods for the preparation of mixed backbone oligomeric,
CC   or chimeric, compounds having phosphodiester internucleoside linkages in
CC   addition to phosphorothioate and/or phosphoramidate internucleoside
CC   linkages. The methods also include incorporation of boranophosphate
CC   internucleoside linkages. The methods utilise H-phosphonate intermediates
CC   that are coupled together forming contiguous regions of 1 or more H-
CC   phosphonate internucleoside linkages. Each contiguous region is
CC   subsequently oxidized to phosphodiester, phosphorothioate,
CC   phosphoroamidate or boranophosphate internucleoside linkages prior to
CC   further elongation. Mixed backbone oligomeric compounds are prepared in
CC   this manner by oxidizing adjacent regions with different reagents.
CC   Oligomeric compounds of the invention are prepared using novel oxidation
CC   steps that oxidize a region of 1 or more H-phosphonate internucleoside
CC   linkages without degrading existing linkages that have been previously
CC   oxidized. The oligonucleotides obtained are useful as primers in PCR,
CC   probes, linkers, gene fragments and for other diagnostic tests on e.g.
CC   biological tissue, fluid, cells etc., as research reagents, and as
CC   antiviral agents

PT Modifying a 3' terminus of a pre-selected DNA sequence, useful for
PT labeling and modifying 3'-termini of other nucleic acids, comprises using
PT a synthetic nucleotide template with a defined overhang nucleotide.
XX
PS Example 5; Col 13; 22pp; English.
XX
CC The sequence represents a synthetic DNA template molecule used to
CC demonstrate the method of the invention. The invention relates to a
CC method of modifying (e.g. 3' end labelling with 32P dATP) the 3' terminus
CC of an RNA molecule by providing a DNA oligonucleotide, complimentary to
CC the 3' end of the RNA molecule, with an overhang at the 5' end which
CC allows incorporation of the labeling nucleotide into the RNA molecule.
CC The method, based on the synthesis of Okazaki fragments, is useful for
CC labeling and modifying the 3'-termini of other nucleic acids such as DNA
CC fragments. The method is a simple and efficient way of labeling or
CC modifying RNA 3'-termini using DNA polymerase and a synthetic template
CC with defined overhang nucleotides

PT Fibronectin scaffold protein array for obtaining a protein/compound which
PT binds to a compound/protein, comprises a fibronectin type III domain
PT having a randomized loop, a randomized beta-sheet or their combination.
XX
PS Disclosure; Page 41; 67pp; English.
XX
CC The present invention relates to an array of proteins (antibody mimics)
CC comprising a fibronectin type III domain having a randomised loop, a
CC randomised beta-sheet, or their combination, and has the capacity to bind
CC to a compound that is not bound by a corresponding naturally- occurring
CC fibronectin, immobilised onto a solid support. The antibody mimics is
CC useful for detecting a compound preferably a protein, in a biological
CC sample. It is also useful to detect one or more different analytes
CC simultaneously in a sample. Hence is useful for diagnostic purposes. It
CC is also useful for the purpose of designing proteins capable of binding
CC to virtually any compound of interest. The present sequence is a capture
CC probe used to self-assemble and anchor the tenth module of human
CC fibronectin module of type III (Fn3) (10Fn3) which is used in an
CC exemplification of the invention

PT New substituted aryl conjugates of parent molecules, especially
PT oligonucleotides, having improved transmembrane and intracellular
PT transport properties, useful as medicaments or diagnostic agents.
XX
PS Disclosure; Page 9; 28pp; German.
XX
CC This invention describes a novel conjugate (I) which consists of (A) a
CC molecule to be transported and (B) at least one aryl residue of formula -
CC Ar-(X-C(Y)-R_1)_n (II). Ar = group containing at least one aromatic ring;
CC X = O or N (sic); Y = O, S or NH-R_2 (sic); R_1 = optionally substituted
CC 1-23C alkyl (optionally containing double and/or triple bonds); R_2 =
CC optionally substituted 1-18C alkyl (optionally containing double and/or
CC triple bonds); n = integer of 1 or more. (A) is bonded to (B) directly or
CC via a chemical group, provided that the chemical group is other than CH_2
CC -S if the bond is via a phosphodiester linkage of (A). The invention also
CC describes (i) the preparation of a conjugate (I') of (A') a molecule to
CC be transported and (B') at least one aryl residue (not restricted to
CC (II)), by preparing (A') containing a reactive function at the position
CC at which (B') is to be bonded, preparing (B') and reacting (A') and (B');
CC and (ii) the use of aryl groups (II) (optionally bonded via a chemical
CC group) for transporting (A) across biological membranes. The products of
CC the invention have cytostatic, virucide, vasotropic, dermatological,
CC antipsoriatic and antiasthmatic activity and can be used for gene
CC therapy. Conjugation of (A) with (B) is useful for transporting (A)
CC across biological membranes or into eukaryotic or prokaryotic cells
CC (specifically bacterial, yeast or mammalian cells, including human cells,
CC particularly tumor cells). Medicaments, diagnostic agents and test kits
CC containing (I) are also claimed. Typically (I) are antisense
CC oligonucleotide derivatives for tumor therapy; oligonucleotide drugs for
CC treating viral infections or diseases associated with integrins or cell-
CC cell interactions (e.g. restenosis, vitiligo, psoriasis or asthma); or
CC labeled oligonucleotides for in vivo diagnostic use, e.g. by in situ
CC hybridization. Conjugation with (B) markedly improves the cellular uptake
CC of (A), e.g. in tumor cells. (B) include fluorescein derivative residues,
CC in which case the conjugates (I) are fluorescently labeled, allowing
CC microscopic monitoring of cellular uptake etc. The cellular uptake of (I)
CC is superior to that obtained using other conjugated groups related to
CC (II); e.g. oligonucleotides conjugated with fluorescein diacetate (within
CC the scope of (B)) have superior uptake to corresponding fluorescein
CC conjugates

PT Detecting and separating nucleic acid, useful e.g. for diagnosis,
PT comprises reaction with nanoparticles that carry oligonucleotides
PT complementary to parts of the target.
XX
PS Example 18; Page 158; 404pp; English.
XX
CC The invention relates to a method for detection of nucleic acid (I)
CC having at least 2 portions, comprising treatment with nanoparticles that
CC carry oligonucleotides complementary to at least 2 parts of (I), where
CC detectable change caused by hybridisation of the oligonucleotide to (I)
CC is observed. The method is used to detect (or to separate) specific (I),
CC e.g. for diagnosing a wide variety of diseases, sequencing, in forensic
CC analysis etc., and generally to detect analytes other than (I). The
CC oligonucleotide-derivatised nanoparticles are also useful for preparing
CC nanostructures useful, for example, as biochips, biofilters, mechanical
CC devices, separation membranes, chemical sensors, in computers, and for
CC drug delivery. Very stable nanoparticle-oligonucleotide conjugates can be
CC produced, allowing their direct use (as probes) in polymerase chain
CC reaction, i.e. they survive multiple heating/cooling cycles so do not
CC need to be added after amplification. (I) are detected by simple colour

```
CC   change, without the need for special equipment, making possible rapid
CC   field testing for e.g. pathogens. AAS63374-AAS63448 represent
CC   oligonucleotide-nanoparticle probes, and related sequences, used in the
CC   method of the invention

PT   Detecting nucleic acid, useful for e.g. diagnosis of diseases, forensics
PT   and DNA sequencing, comprises observing detectable change brought about
PT   by hybridization of nucleic acid with substrate or particle bound
PT   oligonucleotides.
XX
PS   Disclosure; Page 199; 205pp; English.
XX
CC   The present sequence is an oligonucleotide used in a method for detecting
CC   a nucleic acid having at least 2 portions. The method comprises
CC   hybridising the nucleic acid with oligonucleotides, such as the present
CC   sequence, attached to a substrate and/or particle and detecting a change
CC   in colour, conductivity or optical density. The method is useful for the
CC   diagnosis and/or monitoring of diseases, in forensics, in DNA sequencing,
CC   for paternity testing, for cell line authentication and for monitoring
CC   gene therapy. Detecting nucleic acids based upon observing a colour
CC   change is cheap, fast, simple, and does not require specialised or
CC   expensive equipment. The nanoparticle oligonucleotide conjugates remain
CC   stable for at least 6 months. A single base mismatch and as little as 20
CC   femtomoles (fM) of target can be detected using the conjugates

PT   Detecting a nucleic acid useful in e.g. diagnosing genetic, bacterial or
PT   viral diseases, by contacting the nucleic acid with oligonucleotides
PT   attached to nanoparticles and having sequences complementary a portion of
PT   the nucleic acid.
XX
PS   Example 24; Fig 44; 323pp; English.
XX
CC   The sequence represents a cyclic disulphide linked oligonucleotide which
CC   may be coupled with colloidal gold particles (nanoparticles) and used to
CC   demonstrate the method of the invention. The invention relates to
CC   isolating or detecting a nucleic acid of interest, in a mixture of
CC   nucleic acids, by binding it to 2 or more complimentary nucleotides which
CC   have a nanoparticle attached to their 5' ends. The nanoparticles (e.g.
CC   colloidal gold) are used to both isolate and detect (e.g. by linking the
CC   particle to a fluorescent probe) the resultant complex. The methods are
CC   useful for detecting nucleic acids, natural or synthetic, and modified or
CC   unmodified. The methods may also be applied in the diagnosis of genetic,
CC   bacterial and viral diseases, in forensics, in DNA sequencing, for
CC   paternity testing, for cell line authentication, and for monitoring gene
CC   therapy. The methods are further useful in research and analytical
CC   laboratories in DNA sequencing, in the field to detect the presence of
CC   specific pathogens, for quick identification of an infection to assist in
```

```
CC   drug prescription, and in homes and health centres for inexpensive first-
CC   line screening. The methods, which are based on observing colour change
CC   with the naked eye, are cheap, fast, simple, robust (reagents are
CC   stable), do not require specialised or expensive equipment, and little or
CC   no instrumentation is required

CC   The present invention relates to a method for stimulating an immune
CC   response. The method comprises administering an immunostimulatory nucleic
CC   acid to a non-rodent subject in sufficient quantity to stimulate an
CC   immune response. The present sequence is one such immunostimulatory
CC   nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
CC   (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
CC   against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
CC   and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,
CC   haemophilus, campylobacter, clostridium, Escherichia coli and/or
CC   staphylococcus), fungal antigens and/or parasitic antigens. The method is
CC   also useful for preventing cancer, asthma, infectious disease, allergy or
CC   immune deficiency. The present sequence can also be used to redirect a
CC   Th2 to a Th1 immune response and to activate immune cells. Note: the
CC   present sequence may have a phosphorothioate backbone

PT Screening nucleic acids (NA) in pool of interest comprises pooling,
PT expressing NA to form expression product pool and identifying NA in NA
PT pool corresponding to expression product pool having interaction with
PT target moiety.
XX
PS Disclosure; Col 22; 19pp; English.
XX
CC The specification describes a method for identifying a nucleic acid in a
CC pool of interest. The method comprises pooling individually identifiable
CC nucleic acids into at least two pools of one nucleic acid each;
CC expressing nucleic acid pools to obtain protein expression product pools;
CC assaying protein expression product pools for products having interaction
CC with target molecule; selecting nucleic acid pools corresponding to
CC identified protein expression product pools; and identifying individual
CC nucleic acids in identified nucleic acid pools. The method is useful for
CC identifying a nucleic acid (e.g. cDNA) in a pool of interest and for
CC functionally screening several nucleic acids. The method is also useful
CC for screening genomic DNA libraries or other source of individual cDNAs,
CC mRNAs, synthetic libraries of nucleic acids e.g. combinatorial libraries.
CC The present sequence was used in the course of the invention

XX
PT Preparing novel deoxynucleic alkyl thiourea oligonucleotide for use in
PT antisense therapy, by synthesizing oligonucleotides comprising backbone
PT of alkyl or alkoxy thiourea linkages in solution or on solid phase.
XX
PS Example 7; Fig 16; 48pp; English.
XX
CC The present sequence was used to demonstrate the ability of deoxynucleic
CC S-Methythiourea (DNmt) compounds to form triplexes with DNA oligomers. An
CC increase in the C content of the oligos resulted in a large decrease in
CC binding. This experiment was performed as an example of a method for
CC preparing oligonucleotides comprising a backbone of alkyl or alkoxy
CC thiourea linkages. The method is useful for preparing oligonucleotides
CC for use in antisense or antigene therapy, to inhibit production of
CC proteins associated with genetic diseases, cardiovascular, inflammatory
CC and neurocellular diseases, and for antiviral therapy, e.g. to treat
CC human immunodeficiency virus, human-cytomegalovirus, influenza and herpes
CC infections. The compounds are also useful as diagnostic reagents to
CC detect the presence or absence of the target DNA or RNA sequences to
CC which they specifically bind and by antagonising the normal biological
CC activity of a target protein, they can be used in the manipulation of
CC tissue e.g. tissue differentiation, both in vivo and in ex vivo tissue
CC cultures. The method provides an efficient and rapid solid-phase method
CC for the synthesis of thiourea and S-methylthiourea

PT   Detecting 1 base polymorphism on a sequence of a chromosome or it's
PT   fragment.
XX
PS   Example 2; Page 10; 10pp; Japanese.
XX
CC   The invention relates to a method for detecting 1 base polymorphism on
CC   the sequence of a chromosome or its fragment in which a sample nucleic
CC   acid is reacted with a reaction liquor containing a nucleic acid primer
CC   having a base adjacent to the polymorphic base at its 3'-end, one
CC   dideoxynucleotide corresponding to a polymorphic base having a
CC   distinguishable feature or its mixture, DNA polymerase and a composition
CC   required for its activity expression to detect the presence of taking
CC   dideoxynucleotide in the nucleic acid primer and to detect the type of
CC   the base to be specified. The method is used for detecting 1 base
CC   polymorphism on the sequence of a chromosome or its fragment. The present
CC   sequence is that of a PCR primer, useful in examples of the invention

PT   Detecting nucleic acid, useful for diagnosis of genetic, viral or
PT   bacterial disease, comprises hybridizing nanoparticles with attached
PT   oligonucleotides to nucleic acid and detecting change brought about by
PT   hybridization.
XX
PS   Example 18; Page 410; 412pp; English.
XX
CC   The invention relates to a method of detecting a nucleic acid (NA) having
CC   at least 2 portions comprising: (a) providing nanoparticles (NP) with
CC   attached oligonucleotides (OGN), where OGN has a sequence complementary
CC   to the sequence of NA; (b) contacting NA and NP under conditions
CC   effective to allow hybridisation of OGN with NA; and (c) observing a
CC   detectable change brought about by hybridisation of OGN with NA. The
CC   method is useful for detecting a nucleic acid, separating a selected
CC   nucleic acid from others and methods of nanofabrication. Detecting
CC   analytes such as nucleic acids and proteins are useful for the diagnosis
CC   of genetic, bacterial and viral diseases. The OGN-NP conjugates that use
CC   cyclic disulphide linkers improve the sensitivity of diagnostic assays.
CC   In particular assays using OGN-NP conjugates prepared using linkers
CC   comprising a steroid residue attached to a cyclic disulphide have been
CC   found to be approximately 10 times more sensitive than assays employing
CC   conjugates prepared using alkanethiols or acyclic disulphides as the
CC   linker. The OGN-NP conjugates are stable allowing them to be used
CC   directly in PCR solutions. Therefore conjugates added as probes to a DNA
CC   target to be PCR amplified can be carried through the 30 or 40 heating
CC   cooling cycles of the PCR and are still able to detect the amplicons
CC   without opening the tubes and causing contamination. ABK64981-ABK65055

PT   Synthesis of polynucleotide useful during fabrication of an array
PT   involves coupling nucleoside phosphoramidite and a solid-supported
PT   nucleoside and treating the product with an oxidation/deprotection
PT   composition.
XX
PS   Example 1; Page 15; 36pp; English.
XX
CC   The present invention relates to a method for the synthesis of a
CC   polynucleotide which involves coupling a second nucleoside to a first
CC   nucleoside through a phosphite linkage, where the second nucleoside has a
CC   non-carbonate protecting group protecting a hydroxyl, and exposing the
CC   product to a composition which concurrently oxidizes the phosphite formed
CC   to a phosphate and deprotects the protected hydroxyl of the second
CC   nucleoside. The method is useful for synthesizing the polynucleotides,
CC   for carrying out either 3' to 5' or 5' to 3' synthesis and for
CC   fabricating an addressable array of polynucleotides on a substrate. The
CC   present sequence is an oligonucleotide produced to demonstrate the method
CC   of the invention

PT New non-antibody proteins having an immunoglobulin fold, useful in
PT research, therapeutic or diagnostic fields, particularly as scaffolds for
PT designing proteins with specific properties, e.g. for binding any antigen
PT of interest.
XX
PS Disclosure; Page 58; 94pp; English.
XX
CC The present invention describes a non-antibody protein, comprising a
CC domain having an immunoglobulin-like fold, derived from a reference
CC protein having a mutated amino acid sequence, where the non-antibody
CC protein binds with a Kd at least as tight as 10 nM to a compound that is
CC not bound as tightly by the reference protein. The non-antibody protein
CC is useful as scaffolds for selecting or designing a protein framework
CC with specific and favourable properties, e.g. for binding any antigen of
CC interest, or for destroying or inactivating antibody molecules. The non-
CC antibody protein is also useful in all areas where antibodies are used,
CC e.g. research, therapeutic or diagnostic fields, and for screening novel
CC binding proteins useful in the above-mentioned fields. The present

CC proteins have thermodynamic properties superior to those of natural
CC antibodies, and can be evolved rapidly in vitro. The present proteins or
CC antibody mimics exhibit improved biophysical properties, such as
CC stability under reducing conditions and solubility at high
CC concentrations. In addition, these molecules are readily expressed and
CC folded in prokaryotic systems (e.g. Escherichia coli), in eukaryotic
CC systems (e.g. yeast), or in in vitro translation systems (e.g. rabbit
CC reticulocyte lysate system). Furthermore, these proteins are extremely
CC amenable to affinity maturation techniques involving multiple cycles of
CC selection, e.g. in vitro selection using RNA-protein fusion technology,
CC phage display or yeast display systems. The present sequence is used in
CC the exemplification of the present invention

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 3509; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,

```
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/published_pct_sequences

CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,

```
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/published_pct_sequences

PT   Pharmaceutical composition for treating ailments associated with impaired
PT   respiration, has oligo(s) antisense to specific gene(s) or its
PT   corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT   ubiquinone.
XX
PS   Claim 15; SEQ ID NO 553; 872pp; English.
XX
CC   The invention relates to a novel pharmaceutical composition, which has a
CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
```

```
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Claim 15; SEQ ID NO 775; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,

CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

PT   Detecting nucleic acids having 2 portions e.g. for detecting disease,
PT   comprises use of nanoparticles which have oligonucleotides attached to
PT   them that are complementary to portions of the nucleic acid sequence.
XX
PS   Example 18; Page 44; 130pp; English.
```

XX
CC This invention relates to a novel method for detecting a nucleic acid
CC having 2 portions. The method comprises providing nanoparticles having
CC oligonucleotides attached, where the oligonucleotide on each nanoparticle
CC has a sequence complementary to a sequence of 2 portions of nucleic acid.
CC The nucleic acid and nanoparticle are contacted to allow hybridisation of
CC the oligonucleotide on the nanoparticle with two or more portions of
CC nucleic acid and observing a detectable change brought about by the
CC hybridisation. The method of the invention is useful for separating a
CC selected nucleic acid having 2 portions, from other nucleic acids, and
CC for detecting nucleic acids having 2 portions. The method of the
CC invention is useful for detecting any type of nucleic acids which may be
CC used for diagnosis of disease and in sequencing of nucleic acids.
CC Preferably, the method is useful for detecting nucleic acids for
CC diagnosis and/or monitoring of viral diseases (human immunodeficiency
CC virus, hepatitis virus, herpes virus, cytomegalovirus and Epstein-Barr
CC virus), bacterial diseases, sexually transmitted diseases, inherited
CC disorders, in forensics, in DNA sequencing, for paternity testing, for
CC cell line authentication, for monitoring gene therapy, etc. This method
CC involves detecting nucleic acids based on observing a colour change with
CC the naked eye so is cheap, fast, simple and robust, and does not require
CC specialised expensive equipment. The present sequence represents a thiol
CC modified oligonucleotide sequence used to demonstrate the method of the
CC invention

PT Detection or quantification of nucleic acid analyte, by hybridizing a
PT nucleic acid probe having non-identical covalently attached dyes, with
PT nucleic acid analyte, and measuring change in fluorescence of the probes.
XX
PS Example 9; Page 32; 110pp; English.
XX
CC The present sequence is an example of nucleic acid probes of the
CC invention. The probe may be doubly labelled with non-identical covalently
CC attached dyes, e.g. the fluorescent intercalator ethidium, which serves
CC as the detector dye and the fluorescent dye fluorescein, which serves as
CC the donor dye of a fluorescent resonance energy transfer (FRET) system. A
CC bifunctional linker was used to attach the dyes to the oligonucleotide.
CC The probe generates a fluorescent signal upon hybridisation to a
CC complementary nucleic acid based on the interaction of the intercalator
CC with the formed double-stranded DNA. Nucleic acid probes of the invention
CC can be used in homogeneous assays, real-time PCR monitoring,
CC transcription assays, expression analysis on nucleic acid microarrays and
CC other microarray applications such as genotyping

PT Preparing internucleotide phosphorothioate linkage enhanced in Sp/Rp
PT enantiomer, by coupling a synthon with 2'-substituted nucleoside in
PT presence of coupling agent having a pKa that enhances linkage in Sp/Rp
PT enantiomer.
XX
PS Example 1; Page 31; 65pp; English.
XX
CC The present invention describes a method (M1) for preparing an
CC internucleotide phosphorothioate linkage enriched in the Sp or Rp
CC enantiomer between a synthon having a hydroxyl moiety at the 5' position
CC and a 2'-substituted nucleoside having an activated phosphate moiety at
CC the 3'-position, comprising coupling a synthon with a 2'-substituted
CC nucleoside in the presence of coupling agent that is selected to enhance
CC either the Rp or Sp enantiomer according to its pKa. This method is
CC useful for preparing an oligonucleotide having at least one region of
CC internucleotide linkages that is enhanced in the Sp or Rp enantiomer,
CC which involves providing a nucleotide having a hydroxyl moiety at the 5'-
CC position or a growing oligonucleotide chain having a hydroxyl moiety at

```
CC   the 5'-position, coupling the nucleotide or growing oligonucleotide chain
CC   to a 2'-substituted nucleoside having an activated phosphate moiety at
CC   the 3' position in the presence of the coupling agent, and repeating the
CC   coupling step until the desired number of linkages is established. The
CC   oligonucleotide having a region of internucleotide linkages that is
CC   enhanced in the Sp enantiomer is further processed to include another
CC   region of internucleotide linkages that is enhanced in the Sp and/or Rp
CC   enantiomer. Oligonucleotides prepared by the method lead to improved
CC   drugs, diagnostics and research reagents. The present sequence represents
CC   an oligonucleotide used in the exemplification of the present invention

PT   Detecting nucleic acid having two portions, by providing nanoparticles
PT   having oligonucleotides attached to it, contacting nucleic acid and
PT   nanoparticles to allow hybridization, and observing detectable change.
XX
PS   Example 18; Page 179; 467pp; English.
XX
CC   The invention relates to a method of detecting a nucleic acid having two
CC   portions. The method involves providing nanoparticles having
CC   oligonucleotides attached to it which has a sequence complementary to
CC   sequence of two portions of nucleic acid, contacting nucleic acid and
CC   nanoparticles to allow hybridisation of oligonucleotides with two or more
CC   portions of nucleic acid and observing a detectable change brought about
CC   by hybridisation. The method and aggregate probes are useful for
CC   detecting two or more nucleic acids (from a biological source) having at
CC   least two portions such as viral RNA, bacterial or fungal DNA, a gene
CC   associated with a disease, synthetic or structurally modified natural or
CC   synthetic RNA or DNA, or a product of a polymerase chain reaction
CC   amplification. The invention is useful for preparing a nanoprobe
CC   conjugate for detecting an analyte and for detecting a nucleic acid bound
CC   to an electrode surface. It is also useful for fabrication and for
CC   separating a selected nucleic acid having two portions from other nucleic
CC   acids. The present sequence is an oligo used to illustrate the method of
CC   the invention

PT   New DNA sequences from potato, useful for producing plants with altered
PT   properties, e.g. tolerance of flooding, also related proteins, antibodies
PT   and inhibitory sequences.
XX
PS   Example 1; Page 8; 26pp; German.
XX
CC   The invention relates to DNA sequences (I) that encode six specific plant
CC   proteins: (i) a protein (ABP60425) with mitochondrial carrier protein
CC   activity (IIa); (ii) a protein (ABP60426) with transferrin binding
CC   protein activity (IIb); (iii) a protein (ABP60427) with receptor-like
CC   protein kinase activity (IIc); (iv) a protein (ABP60428) with elongation
CC   factor EF-2 activity (IId); (v) a protein (ABP60429) with non-long
CC   terminal repeat retroelement reverse transcriptase activity (IIe); or
CC   (vi) a protein (ABP60430) with helicase activity (IIf). (I), also related
CC   sequences, derived ribozymes and antisense sequences, expression vectors,
CC   encoded proteins and antibodies against the proteins, are used to produce
CC   plants with altered properties, including tolerance of overwatering. The
CC   antibodies are also used for isolation of the proteins and in
CC   immunoassays. Also (I) or their primer or probe fragments are used to
CC   screen for terminators and constitutively, aerobically or anaerobically
CC   inducible plant promoters, specifically for use in potatoes and the
CC   sequence that encodes (IId) is used to alter the translation profile in
CC   plants. Since (I) are derived from potato, their promoters and
CC   terminators provide high level transgene expression in potato, with
CC   improved tissue specificity and inducibility, and can also be used to
CC   control endogenous genes. The present sequence is that of a PCR primer
CC   used in the first strand synthesis of cDNAs derived from Potato

PT   Detecting nucleic acids having at least 2 portions comprises use of
PT   nanoparticles which have oligonucleotides attached to them that are
PT   complementary to portions of the nucleic acid sequence.
XX
PS   Example 18; Page 44; 130pp; English.
XX
CC   The invention relates to detecting a nucleic acid (NA) having at least 2
CC   portions, comprises providing a type of nanoparticles (NP) having
CC   attached to oligonucleotides (O) ((O) on each NP has a sequence
CC   complementary to sequence of at least 2 portions of NA), contacting NA
CC   and NP to allow hybridisation of (O) on NP with 2 or more portions of NA,
CC   and observing a detectable change brought about by hybridisation of (O)
CC   on NP with NA. The nanoparticle is useful for separating a selected
CC   nucleic acid having at least 2 portions, from other nucleic acids, and
CC   for detecting nucleic acids having at least 2 portions. The method of
CC   using NP is useful for detecting any type of nucleic acids which may be
CC   used for diagnosis of disease and in sequencing of nucleic acids.
CC   Preferably, the method is useful for detecting nucleic acids for
CC   diagnosis and/or monitoring of viral diseases (human immunodeficiency
CC   virus, hepatitis virus, herpes virus, cytomegalovirus and Epstein-Barr
CC   virus), bacterial diseases, sexually transmitted diseases, inherited
CC   disorders, in forensics, in DNA sequencing, for paternity testing, for
CC   cell line authentication and for monitoring gene therapy. The method is
CC   useful in research and analytical laboratories in DNA sequencing and in
CC   the field to detect the presence of specific pathogens. Detecting nucleic
CC   acids based on observing a colour change with the naked eye is cheap,
CC   fast, simple and robust, and do not require specialised expensive
CC   equipment. The present sequence is a nanoparticle (e.g. gold particles)
CC   labelled probe used to demonstrate the method of the invention

PT Detection of nucleic acid for, e.g. research and analytical laboratories
PT in deoxyribonucleic acid sequencing, involves contacting nucleic acid
PT with nanoparticles having oligonucleotides.
XX
PS Example 18; Page 43; 109pp; English.
XX
CC This invention relates to a novel method for detecting a nucleic acid by
CC contacting a nucleic acid with at least two types of nanoparticles having
CC oligonucleotides attached, allowing hybridisation of the oligonucleotides
CC on the nanoparticles, and observing a detectable change. The
CC oligonucleotides on each nanoparticle have a sequence complementary to
CC its respective portion of the sequence of the nucleic acid to be
CC detected. The method of the invention may be used for the detection of a
CC nucleic acid used in, e.g. research and analytical laboratories in DNA
CC sequencing, in the field to detect the presence of specific pathogens, in
CC the doctor's office for quick identification of an infection to assist in
CC prescribing a drug for treatment, and in homes and health centres for
CC inexpensive first-line screening. The method of the invention detects
CC nucleic acids based on observing a colour change with the naked eye. This
CC method is cheap, fast, simple, robust and does not require specialised or
CC expensive equipment. The present sequence represents a thiol modified
CC oligonucleotide sequence used to demonstrate the method of the invention

XX
PT   Detection of nucleic acid having -2 portions used to prepare biomaterials
PT   and in nanofabrication methods, comprises providing nanoparticles,
PT   contacting nucleic acid and nanoparticles, and observing change.
XX
PS   Example 18; Page 44; 130pp; English.
XX
CC   This invention relates to a novel method for detecting nucleic acids. The
CC   method comprises providing nanoparticles with oligonucleotides attached
CC   to them, which have a sequence complementary to a sequence of two
CC   portions of nucleic acid, contacting the nucleic acid and nanoparticles
CC   to allow hybridisation of the oligonucleotides with two or more portions
CC   of the nucleic acid, and observing a detectable change brought about by
CC   the hybridisation. The nucleic acid to be detected must have at least two
CC   portions and the distances between these are chosen so that when the
CC   nanoparticle-oligonucleotide conjugate binds the target sequence a
CC   detectable change occurs. The method of the invention is useful for
CC   detecting two or more nucleic acids (from a biological source) having at
CC   least two portions, such as viral RNA, bacterial or fungal DNA, a gene
CC   associated with a disease, synthetic, or structurally- modified natural
CC   or synthetic RNA or DNA, or a product of a polymerase chain reaction
CC   amplification. Nanoparticle-oligonucleotide conjugates of the invention
CC   are useful for preparing a nanoprobe conjugate for detecting an analyte,
CC   and for detecting a nucleic acid bound to an electrode surface.
CC   Nanoparticles and nanoparticle conjugates of the invention are useful for
CC   nanofabrication and for separating a selected nucleic acid having two
CC   portions from other nucleic acids. Diagnostic assays employing
CC   nanoparticle-oligonucleotide conjugates improve the sensitivity of
CC   nucleic acid detection methods and can be used to detect nucleic acids
CC   that are present in only small amounts in a sample. The invention also
CC   provides highly desirable nanoparticle-oligonucleotide conjugates. These
CC   conjugates are stable with tailored hybridisation abilities. The present
CC   sequence represents a thiol modified oligonucleotide sequence used to
CC   demonstrate the method of the invention

CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of transcription factor-2 gamma (TFAP2C).
CC   TFAP2C is also known as AP-2 gamma, AP2-gamma, AP-2.2, Stra2, activating
CC   enhancer-binding protein 2 gamma, oestrogen receptor factor-1 and ERF-1.
CC   The invention is useful for inhibiting the expression of TFAP2C in cells
CC   or tissues. It is useful for treating an animal having a disease or
CC   condition associated with TFAP2C, e.g., a hyperproliferative disorder
CC   such as cancer e.g. breast cancer or colon cancer and a developmental
CC   disorder. The invention is also useful for diagnostics, therapeutics,
CC   prophylaxis and as research reagents and kits. It is also used in
CC   antisense therapy. The present sequence is an antisense oligonucleotide
CC   targetted to human TFAP2C DNA. This sequence is used to illustrate the
CC   method of the invention

PT   nucleic acid, and for treating cancer e.g. breast cancer or colon cancer.
XX
PS   Claim 3; Page 80; 107pp; English.
XX
CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of transcription factor-2 gamma (TFAP2C).
CC   TFAP2C is also known as AP-2 gamma, AP2-gamma, AP-2.2, Stra2, activating
CC   enhancer-binding protein 2 gamma, oestrogen receptor factor-1 and ERF-1.
CC   The invention is useful for inhibiting the expression of TFAP2C in cells
CC   or tissues. It is useful for treating an animal having a disease or
CC   condition associated with TFAP2C, e.g., a hyperproliferative disorder
CC   such as cancer e.g. breast cancer or colon cancer and a developmental
CC   disorder. The invention is also useful for diagnostics, therapeutics,
CC   prophylaxis and as research reagents and kits. It is also used in
CC   antisense therapy. The present sequence is an antisense oligonucleotide
CC   targetted to human TFAP2C DNA. This sequence is used to illustrate the

XX
CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of transcription factor-2 gamma (TFAP2C).
CC   TFAP2C is also known as AP-2 gamma, AP2-gamma, AP-2.2, Stra2, activating
CC   enhancer-binding protein 2 gamma, oestrogen receptor factor-1 and ERF-1.
CC   The invention is useful for inhibiting the expression of TFAP2C in cells
CC   or tissues. It is useful for treating an animal having a disease or
CC   condition associated with TFAP2C, e.g., a hyperproliferative disorder
CC   such as cancer e.g. breast cancer or colon cancer and a developmental
```

```
CC   disorder. The invention is also useful for diagnostics, therapeutics,
CC   prophylaxis and as research reagents and kits. It is also used in
CC   antisense therapy. The present sequence is an antisense oligonucleotide
CC   targetted to human TFAP2C DNA. This sequence is used to illustrate the
CC   method of the invention

PT   New antisense compound targeted to a nucleic acid molecule encoding
PT   transcription factor-2 gamma, useful for inhibiting expression of the
PT   nucleic acid, and for treating cancer e.g. breast cancer or colon cancer.
XX
PS   Example 15; Page 81; 107pp; English.
XX
CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of transcription factor-2 gamma (TFAP2C).
CC   TFAP2C is also known as AP-2 gamma, AP2-gamma, AP-2.2, Stra2, activating
CC   enhancer-binding protein 2 gamma, oestrogen receptor factor-1 and ERF-1.
CC   The invention is useful for inhibiting the expression of TFAP2C in cells
CC   or tissues. It is useful for treating an animal having a disease or
CC   condition associated with TFAP2C, e.g., a hyperproliferative disorder
CC   such as cancer e.g. breast cancer or colon cancer and a developmental
CC   disorder. The invention is also useful for diagnostics, therapeutics,
CC   prophylaxis and as research reagents and kits. It is also used in
CC   antisense therapy. The present sequence is an antisense oligonucleotide
CC   targetted to human TFAP2C DNA. This sequence is used to illustrate the
CC   method of the invention

PT   New antisense compound targeted to a nucleic acid molecule encoding
PT   transcription factor-2 gamma, useful for inhibiting expression of the
PT   nucleic acid, and for treating cancer e.g. breast cancer or colon cancer.
XX
PS   Claim 3; Page 80; 107pp; English.
XX
CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of transcription factor-2 gamma (TFAP2C).
CC   TFAP2C is also known as AP-2 gamma, AP2-gamma, AP-2.2, Stra2, activating
CC   enhancer-binding protein 2 gamma, oestrogen receptor factor-1 and ERF-1.
CC   The invention is useful for inhibiting the expression of TFAP2C in cells
CC   or tissues. It is useful for treating an animal having a disease or
CC   condition associated with TFAP2C, e.g., a hyperproliferative disorder
CC   such as cancer e.g. breast cancer or colon cancer and a developmental
CC   disorder. The invention is also useful for diagnostics, therapeutics,
CC   prophylaxis and as research reagents and kits. It is also used in
CC   antisense therapy. The present sequence is an antisense oligonucleotide
CC   targetted to human TFAP2C DNA. This sequence is used to illustrate the
CC   method of the invention

PT   New antisense compound targeted to a nucleic acid molecule encoding
PT   transcription factor-2 gamma, useful for inhibiting expression of the
PT   nucleic acid, and for treating cancer e.g. breast cancer or colon cancer.
XX
PS   Claim 3; Page 80; 107pp; English.
XX
CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of transcription factor-2 gamma (TFAP2C).
CC   TFAP2C is also known as AP-2 gamma, AP2-gamma, AP-2.2, Stra2, activating
CC   enhancer-binding protein 2 gamma, oestrogen receptor factor-1 and ERF-1.
CC   The invention is useful for inhibiting the expression of TFAP2C in cells
CC   or tissues. It is useful for treating an animal having a disease or
CC   condition associated with TFAP2C, e.g., a hyperproliferative disorder
CC   such as cancer e.g. breast cancer or colon cancer and a developmental
CC   disorder. The invention is also useful for diagnostics, therapeutics,
CC   prophylaxis and as research reagents and kits. It is also used in
CC   antisense therapy. The present sequence is an antisense oligonucleotide
CC   targetted to human TFAP2C DNA. This sequence is used to illustrate the
CC   method of the invention

PT   New antisense compound targeted to a nucleic acid molecule encoding
PT   transcription factor-2 gamma, useful for inhibiting expression of the
PT   nucleic acid, and for treating cancer e.g. breast cancer or colon cancer.
XX
PS   Example 15; Page 81; 107pp; English.
XX
CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of transcription factor-2 gamma (TFAP2C).
CC   TFAP2C is also known as AP-2 gamma, AP2-gamma, AP-2.2, Stra2, activating
CC   enhancer-binding protein 2 gamma, oestrogen receptor factor-1 and ERF-1.
CC   The invention is useful for inhibiting the expression of TFAP2C in cells
CC   or tissues. It is useful for treating an animal having a disease or
CC   condition associated with TFAP2C, e.g., a hyperproliferative disorder
CC   such as cancer e.g. breast cancer or colon cancer and a developmental
CC   disorder. The invention is also useful for diagnostics, therapeutics,
CC   prophylaxis and as research reagents and kits. It is also used in
```

```
CC   antisense therapy. The present sequence is an antisense oligonucleotide
CC   targetted to human TFAP2C DNA. This sequence is used to illustrate the
CC   method of the invention

PT   New antisense compound targeted to a nucleic acid molecule encoding
PT   transcription factor-2 gamma, useful for inhibiting expression of the
PT   nucleic acid, and for treating cancer e.g. breast cancer or colon cancer.
XX
PS   Example 15; Page 79; 107pp; English.
XX
CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of transcription factor-2 gamma (TFAP2C).
CC   TFAP2C is also known as AP-2 gamma, AP2-gamma, AP-2.2, Stra2, activating
CC   enhancer-binding protein 2 gamma, oestrogen receptor factor-1 and ERF-1.
CC   The invention is useful for inhibiting the expression of TFAP2C in cells
CC   or tissues. It is useful for treating an animal having a disease or
CC   condition associated with TFAP2C, e.g., a hyperproliferative disorder
CC   such as cancer e.g. breast cancer or colon cancer and a developmental
CC   disorder. The invention is also useful for diagnostics, therapeutics,
CC   prophylaxis and as research reagents and kits. It is also used in
CC   antisense therapy. The present sequence is an antisense oligonucleotide
CC   targetted to human TFAP2C DNA. This sequence is used to illustrate the
CC   method of the invention

PT   New antisense compound targeted to a nucleic acid molecule encoding
PT   transcription factor-2 gamma, useful for inhibiting expression of the
PT   nucleic acid, and for treating cancer e.g. breast cancer or colon cancer.
XX
PS   Example 15; Page 80; 107pp; English.
XX
CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of transcription factor-2 gamma (TFAP2C).
CC   TFAP2C is also known as AP-2 gamma, AP2-gamma, AP-2.2, Stra2, activating
CC   enhancer-binding protein 2 gamma, oestrogen receptor factor-1 and ERF-1.
CC   The invention is useful for inhibiting the expression of TFAP2C in cells
CC   or tissues. It is useful for treating an animal having a disease or
CC   condition associated with TFAP2C, e.g., a hyperproliferative disorder
CC   such as cancer e.g. breast cancer or colon cancer and a developmental
CC   disorder. The invention is also useful for diagnostics, therapeutics,
CC   prophylaxis and as research reagents and kits. It is also used in
CC   antisense therapy. The present sequence is an antisense oligonucleotide
CC   targetted to human TFAP2C DNA. This sequence is used to illustrate the
CC   method of the invention

PT   New antisense compound targeted to a nucleic acid molecule encoding
PT   transcription factor-2 gamma, useful for inhibiting expression of the
PT   nucleic acid, and for treating cancer e.g. breast cancer or colon cancer.
XX
PS   Claim 3; Page 80; 107pp; English.
XX
CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of transcription factor-2 gamma (TFAP2C).
CC   TFAP2C is also known as AP-2 gamma, AP2-gamma, AP-2.2, Stra2, activating
CC   enhancer-binding protein 2 gamma, oestrogen receptor factor-1 and ERF-1.
CC   The invention is useful for inhibiting the expression of TFAP2C in cells
CC   or tissues. It is useful for treating an animal having a disease or
CC   condition associated with TFAP2C, e.g., a hyperproliferative disorder
CC   such as cancer e.g. breast cancer or colon cancer and a developmental
CC   disorder. The invention is also useful for diagnostics, therapeutics,
CC   prophylaxis and as research reagents and kits. It is also used in
CC   antisense therapy. The present sequence is an antisense oligonucleotide
CC   targetted to human TFAP2C DNA. This sequence is used to illustrate the
CC   method of the invention

PT   New antisense compound targeted to a nucleic acid molecule encoding
PT   transcription factor-2 gamma, useful for inhibiting expression of the
PT   nucleic acid, and for treating cancer e.g. breast cancer or colon cancer.
XX
PS   Claim 3; Page 80; 107pp; English.
XX
CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of transcription factor-2 gamma (TFAP2C).
CC   TFAP2C is also known as AP-2 gamma, AP2-gamma, AP-2.2, Stra2, activating
CC   enhancer-binding protein 2 gamma, oestrogen receptor factor-1 and ERF-1.
CC   The invention is useful for inhibiting the expression of TFAP2C in cells
CC   or tissues. It is useful for treating an animal having a disease or
CC   condition associated with TFAP2C, e.g., a hyperproliferative disorder
CC   such as cancer e.g. breast cancer or colon cancer and a developmental
CC   disorder. The invention is also useful for diagnostics, therapeutics,
CC   prophylaxis and as research reagents and kits. It is also used in
CC   antisense therapy. The present sequence is an antisense oligonucleotide
CC   targetted to human TFAP2C DNA. This sequence is used to illustrate the

PT   New antisense compound targeted to a nucleic acid molecule encoding
PT   transcription factor-2 gamma, useful for inhibiting expression of the
PT   nucleic acid, and for treating cancer e.g. breast cancer or colon cancer.
XX
PS   Claim 3; Page 80; 107pp; English.
XX
CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of transcription factor-2 gamma (TFAP2C).
CC   TFAP2C is also known as AP-2 gamma, AP2-gamma, AP-2.2, Stra2, activating
CC   enhancer-binding protein 2 gamma, oestrogen receptor factor-1 and ERF-1.
CC   The invention is useful for inhibiting the expression of TFAP2C in cells
CC   or tissues. It is useful for treating an animal having a disease or
CC   condition associated with TFAP2C, e.g., a hyperproliferative disorder
CC   such as cancer e.g. breast cancer or colon cancer and a developmental
CC   disorder. The invention is also useful for diagnostics, therapeutics,
CC   prophylaxis and as research reagents and kits. It is also used in
CC   antisense therapy. The present sequence is an antisense oligonucleotide
CC   targetted to human TFAP2C DNA. This sequence is used to illustrate the
CC   method of the invention

PT   New antisense compound targeted to a nucleic acid molecule encoding
PT   transcription factor-2 gamma, useful for inhibiting expression of the
PT   nucleic acid, and for treating cancer e.g. breast cancer or colon cancer.
XX
PS   Example 15; Page 80; 107pp; English.
XX
CC   The invention relates to antisense compounds, compositions and methods
CC   for modulating the expression of transcription factor-2 gamma (TFAP2C).
CC   TFAP2C is also known as AP-2 gamma, AP2-gamma, AP-2.2, Stra2, activating
CC   enhancer-binding protein 2 gamma, oestrogen receptor factor-1 and ERF-1.
CC   The invention is useful for inhibiting the expression of TFAP2C in cells
CC   or tissues. It is useful for treating an animal having a disease or
CC   condition associated with TFAP2C, e.g., a hyperproliferative disorder
CC   such as cancer e.g. breast cancer or colon cancer and a developmental
CC   disorder. The invention is also useful for diagnostics, therapeutics,
CC   prophylaxis and as research reagents and kits. It is also used in
CC   antisense therapy. The present sequence is an antisense oligonucleotide
CC   targetted to human TFAP2C DNA. This sequence is used to illustrate the
CC   method of the invention

PT   Detection of nucleic acid having at least two portions, by contacting
PT   nucleic acid and nanoparticles under conditions, which allows
PT   hybridization of oligonucleotides on nanoparticles with at least two
PT   portions of nucleic acid.
XX
PS   Example 18; Page 44; 108pp; English.
XX
CC   This invention relates to a novel method for detecting nucleic acids. The
CC   method comprises providing nanoparticles with oligonucleotides attached
CC   to them, which have a sequence complementary to a sequence of two
CC   portions of nucleic acid, contacting the nucleic acid and nanoparticles
CC   to allow hybridisation of the oligonucleotides with two or more portions
CC   of the nucleic acid, and observing a detectable change brought about by
CC   the hybridisation. The nucleic acid to be detected must have at least two
CC   portions and the distances between these are chosen so that when the
CC   nanoparticle-oligonucleotide conjugate binds the target sequence a
CC   detectable change occurs. The method of the invention is useful for
CC   detecting two or more nucleic acids (from a biological source) having at
CC   least two portions, such as viral RNA, bacterial or fungal DNA, a gene
CC   associated with a disease, synthetic, or structurally- modified natural
CC   or synthetic RNA or DNA, or a product of a polymerase chain reaction
CC   amplification. Nanoparticle-oligonucleotide conjugates of the invention
CC   are useful for preparing a nanoprobe conjugate for detecting an analyte,
CC   and for detecting a nucleic acid bound to an electrode surface.
CC   Nanoparticles and nanoparticle conjugates of the invention are useful for
CC   nanofabrication and for separating a selected nucleic acid having two
CC   portions from other nucleic acids. Diagnostic assays employing
CC   nanoparticle-oligonucleotide conjugates improve the sensitivity of
CC   nucleic acid detection methods and can be used to detect nucleic acids
CC   that are present in only small amounts in a sample. The invention also
CC   provides highly desirable nanoparticle-oligonucleotide conjugates. These
CC   conjugates are stable with tailored hybridisation abilities. The present
CC   sequence represents a thiol modified oligonucleotide sequence used to
CC   demonstrate the method of the invention

PT Hairpin sensor useful for detecting a target nucleotide sequence in a
PT sample, comprises a hairpin loop assembly including a complementary probe
PT and a quenchable fluorescing agent.
XX
PS Example 3; Page 11; 16pp; English.
XX
CC The invention discloses a hairpin sensor comprising a hairpin loop
CC assembly including a complementary probe positioned between a first
CC inverse repeat arm and a second inverse repeat arm, and a quenchable
CC fluorescing agent joined, directly or indirectly, to the end of the
CC second inverse repeat arm of the hairpin loop assembly opposite the
CC complementary probe. Also claimed is a microarray comprising the hairpin
CC sensor, where the end of the first inverse repeat arm opposite the
CC complementary probe is bound, directly or indirectly, to a support, a kit
CC for detecting a target nucleotide sequence in a sample comprising the
CC hairpin sensor, and a support, and a hairpin sensor system, in which the
CC particle is conductive or semi-conductive, including at least one of the
CC above hairpin sensor assemblies. The hairpin sensor further comprises a
CC functional group joined to the end of the first inverse repeat arm
CC opposite the complementary probe, or first spacer opposite the first
CC inverse repeat arm, the functional group selected from amino, carboxyl,
CC thiol and hydroxyl. Further, the sensor comprises a ligand positioned
CC between the second inverse repeat arm and the quenchable fluorescing
CC agent, where the ligand is selected from mercapto, hydroxyl, amino,
CC nitrile and carboxyl, carboxylic acid, organic acid and amino acid. The
CC second spacer is positioned between the second inverse repeat arm and the
CC quenchable fluorescing agent which comprises a semiconductor nanocrystal
CC or rhodamine B-labelled dye. Within the microarray the support is capable
CC of accepting a charge. At least one hairpin sensor comprises two or more
CC hairpin sensors. The two or more hairpin sensors include complementary
CC probes that are the same or different and respective quenchable
CC fluorescing agents that are the same or different. The two or more
CC hairpin sensors are arranged in a spatially-defined pattern. The sensor
CC and system are useful for detecting a target nucleotide sequence in a
CC sample. Further, the method involves identifying the target nucleotide
CC sequence by the location of the complementary probe to which the target
CC nucleotide sequence binds. The two or more hairpin sensors include
CC complementary probes or quenchable fluorescing agents, that are
CC different. The sequence presented is the hairpin oligonucleotide target
CC sequence, #2, used in an example of the invention.

PT Detecting nucleic acids having at least 2 portions comprises use of
PT nanoparticles which have oligonucleotides attached to them that are
PT complementary to portions of the target nucleic acid sequence.
XX
PS Example 18; Page 44; 130pp; English.
XX
CC The invention relates to detecting a nucleic acid (NA) having at least 2
CC portions comprises providing a type of nanoparticles (NP. e.g. colloidal
CC gold) having oligonucleotides (O) attached (where (O) on each NP has a
CC sequence complementary to sequence of at least two portions of NA),
CC contacting NA and NP to allow hybridisation of (O) on NP with 2 or more
CC portions of NA, and observing a detectable change brought about by
CC hybridization of (O) on NP with NA. Also included are aggregate probes,
CC core probes, substrate having NP attached to it, a metallic or
CC semiconductor NP having (O) attached to it, nanomaterials/nanostructures
CC comprising nanoparticles and methods of nanofabrication utilising
CC nanoparticles and satellite probes. The methods, probes nucleic acids,
CC nanoparticles and oligonucleotides are useful for separating a selected
CC nucleic acid having at least two portions, from other nucleic acids, and
CC for detecting nucleic acids having at least two portions, for detecting
CC NA having at least two portions. The method is useful for detecting any
CC type of nucleic acids which may be used for diagnosis of disease and in
CC sequencing of nucleic acids. Preferably, the method is useful for
CC detecting nucleic acids for diagnosis and/or monitoring of viral diseases
CC (human immunodeficiency virus, hepatitis virus, herpes virus,
CC cytomegalovirus and Epstein-Barr virus), bacterial diseases, sexually
CC transmitted diseases, inherited disorders, in forensics, in DNA
CC sequencing, for paternity testing, for cell line authentication, for
CC monitoring gene therapy, etc. The method is useful in research and
CC analytical laboratories in DNA sequencing, in the field to detect the

```
CC   presence of specific pathogens, etc. Detecting nucleic acids based on
CC   observing a colour change with the naked eye is cheap, fast, simple and
CC   robust, and do not require specialised expensive equipment. The present
CC   sequence is a spacer oligonucleotide used to illustrate the method of the
CC   invention.

PT   Detecting nucleic acid having two portions, by providing nanoparticles
PT   having oligonucleotides attached to it, contacting nucleic acid and
PT   nanoparticles to allow hybridization, and observing detectable change.
XX
PS   Example 18; Page 43; 129pp; English.
XX
CC   This invention relates to a novel method for detecting nucleic acids. The
CC   method comprises providing nanoparticles with oligonucleotides attached
CC   to them, which have a sequence complementary to a sequence of two
CC   portions of nucleic acid, contacting the nucleic acid and nanoparticles
CC   to allow hybridisation of the oligonucleotides with two or more portions
CC   of the nucleic acid, and observing a detectable change brought about by
CC   the hybridisation. The nucleic acid to be detected must have at least two
CC   portions and the distances between these are chosen so that when the
CC   nanoparticle-oligonucleotide conjugate binds the target sequence a
CC   detectable change occurs. The method of the invention is useful for
CC   detecting two or more nucleic acids (from a biological source) having at
CC   least two portions, such as viral RNA, bacterial or fungal DNA, a gene
CC   associated with a disease, synthetic, or structurally- modified natural
CC   or synthetic RNA or DNA, or a product of a polymerase chain reaction
CC   amplification. Nanoparticle-oligonucleotide conjugates of the invention
CC   are useful for preparing a nanoprobe conjugate for detecting an analyte,
CC   and for detecting a nucleic acid bound to an electrode surface.
CC   Nanoparticles and nanoparticle conjugates of the invention are useful for
CC   nanofabrication and for separating a selected nucleic acid having two
CC   portions from other nucleic acids. Diagnostic assays employing
CC   nanoparticle-oligonucleotide conjugates improve the sensitivity of
CC   nucleic acid detection methods and can be used to detect nucleic acids
CC   that are present in only small amounts in a sample. The present sequence
CC   represents a thiol modified oligonucleotide sequence used to demonstrate
CC   the method of the invention

PT   New self-addressable electronic devices - used for multi-step and
PT   multiplex reactions such as DNA hybridisation(s), clinical diagnostics
PT   and bio:polymer synthesis.
XX
PS   Example 1; Page 40; 86pp; English.
XX
CC   The sequences represented by, AAQ90390-90401 are synthetic DNA probes
CC   containing 3' ribonucleoside termini. The sequences shown in AAQ90402-15
CC   are synthetic DNA probes with 5' amino termini. These sequences were
CC   specific for the polymorphisms of HLA gene dQa. The sequences were used
CC   in the device of the invention. This is a self-addressable electronic
CC   device (SAED) that can be used to carry out multi-step and multiplex
CC   reactions, such as nucleic acid hybridisations. The advantages of this
CC   method are that these reactions can be carried out with complete and
CC   precise electronic control, and that the rate, specificity and
CC   sensitivity of these reactions are greatly improved at micro-locations

CC   The sequences given in AAT10742-67 are synthetic oligonucleotides which
CC   are used in the construction of the electronically self- addressable
CC   device (ED) of the invention. The ED comprises a substrate, an electrode
CC   or opt. a number of electrodes supported by the substrate, a current
CC   source operatively connected to the electrode and an attachment layer
CC   adjacent to the electrode which is permeable to a counterion but not
CC   permeable to a molecule capable of insulating or binding to the
CC   electrode. The attachment layer is capable of attaching a macromolecule.
CC   The ED is used for genetic typing and comprises a number of
CC   electronically addressable locations each comprising an electrode, and a
CC   binding entity, such as one of these probes, attached to each of the
CC   locations capable of detecting the presence of a genetic sequence

PT   New microelectronic device designed to carry out and control multi-step
PT   and multiplex molecular biological reactions in microscopic format.
XX
PS   Example 1; Page 89; 179pp; English.
XX
CC   The specification describes a self-addressable, self-assembling
CC   microelectronic device which is designed to actively carry out and
CC   control multi-step and multiplex molecular biological reactions in
CC   microscopic formats. A key aspect of this inventions is played by the ion
CC   -permeable permeation layer which overlies the electrode. This permeation
CC   layer allows attachment of nucleic acids to permit immobilization but
CC   also separates the attached oligonucleotides and hybridized target DNA
CC   sequences from the highly reactive electrochemical environment generated
CC   immediately at the electrode surface. The microelectronic device is
CC   designed and fabricated to actively carry out and control reactions such
CC   as nucleic acid hybridizations, antibody/antigen reactions, sample
CC   preparation, diagnostics and biopolymer synthesis. The device can
CC   electronically control the transport and attachment of specific binding
CC   entities, such as nucleic acids and polypeptides, to specific micro-
CC   locations. The device can subsequently control the transport and reaction
CC   of analytes or reactants at the addressed specific micro-locations. The
CC   device is able to concentrate analytes and reactants, remove non-
CC   specifically bound molecules, provide stringency control for DNA
CC   hybridization reactions and improve the detection of analytes. The
CC   present sequence represents a probe used to exemplify the invention

PT   New oligomers contg. modified bases - which form a triplex with G-C
PT   doublet in a DNA duplex, for treating and diagnosing HIV, hepatitis,
PT   herpes malignancy and inflammation.
XX
PS   Claim 12; Page 71; 77pp; English.
XX
CC   The synthetic oligomer is capable of forming a triplex at physiological
CC   pH with a purine rich target sequence by coupling into the major groove
CC   of the duplex. The specific target sequence of this oligomer is the human
CC   interleukin 6 gene untranslated sequence contg. a purine rich sequence
CC   concd. on one strand of the duplex. The oligomer, and others like it are
CC   useful in diagnosis and therapy of diseases characterised by specific DNA
CC   duplex targets, e.g. HPV, HER, HIV, hepatitis B, herpes, malignant
CC   tumours and inflammation. The triple helices form under mild conditions
CC   thus assays may be carried out without subjecting the test specimen to
CC   harsh conditions. The oligomer contains an inverted polarity region
CC   formed from an o-xyloso dimer synthon. The linking gp. is o-xyloso
CC   (nucleotides have the 3'positions of xylose sugars linked via the o-
CC   xylene ring). Two nucleotides are coupled through a xylene residue to
CC   form the dimer synthon. This additional modifications may render the
CC   oligomer stable to nuclease activity. The oligomer is able to inhibit
CC   gene expression, as verified by in vitro systems. See also AAQ25452-25501
CC   and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN field.)

PT   Identifying a candidate polymorphic repeat within a coding sequence, for
PT   understanding or treating genetic disease, comprises detecting tandem
PT   repeats in a target coding sequence and scoring the repeats for
PT   polymorphic probability.
XX
PS   Example; Col 579; 588pp; English.
XX
CC   The invention discloses a method for identifying a candidate polymorphic
CC   repeat within a coding sequence (expressed sequence tag, EST), which
CC   comprises detecting tandem repeats in a target coding sequence, scoring
CC   the repeats for polymorphic probability and generating a dataset
CC   correlating the repeats with polymorphic probability to identify a
CC   candidate polymorphic repeat. The computational methods (polymorphic
CC   marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are
CC   useful for identifying and detecting candidate polymorphic repeats in
CC   human genes, which can be used to understand, treat or eliminate genetic
CC   diseases, predispositions or adverse drug-treatment reactions. Examples
CC   of diseases linked to nucleotide repeats are Machado-Joseph, Haw River
CC   syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis,
CC   myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and
CC   spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are
CC   the polymorphic repeats identified for a search of human ESTs

PT   Nucleic acid assay methods - based on restriction fragment length
PT   determination.
XX
PS   Example 1; Page 7; 21pp; English.
XX
CC   The present sequence is a DNA probe used in a novel method of analysis or
CC   assay for nucleotides, which comprises: (i) digesting DNA with a
CC   restriction enzyme; (ii) discriminating a difference in sequences of the
CC   DNA fragments obtained around the 3' termini with a DNA probe and
CC   extending the DNA probe by a complementary strand synthesis to
CC   fractionate the DNA fragments into groups; and (iii) measuring lengths of
CC   the DNA fragments which belong to the groups, or length of the extended
CC   DNA probe, and using the lengths obtained for the fragments around the 3'
CC   termini as fingerprints. Where polyA is present, the presence of
CC   recognition sequence GCG is critical for clarifying the terminal site,
CC   this is because the length of polyA cannot be controlled. The method is
CC   useful for assaying a large number of cDNA molecules or DNA fragments and
CC   for assaying long DNA sequences

PT   New foam protein from cereals useful for improving foam formation,
PT   stability and half-life in foaming products such as beverages and
PT   especially beer.
XX
PS   Example 6; Page 22; 82pp; English.
XX
CC   The present sequence represents a primer used to reverse transcribe mRNA
CC   encoding the barley 17 kDa foam protein. The protein has foam enhancing
CC   properties, and belongs to the prolamin storage protein family. It is
CC   found in the endosperm tissue of mature cereal grain, and is synthesised
CC   during grain development. The 17 kDa foam protein can be added to
CC   products, e.g. foaming beverages such as beer, to enhance the foaming
CC   quality of the product. The protein can be used to produce improved
CC   brewed products. The proteins and polynucleotides are especially useful
CC   for improving the formation, stability and half-life of the foam head on
CC   beer. The antibodies are useful to detect, measure and purify the
CC   proteins in samples such as transgenic cells/plants and foaming products

PT   Determining whether a product of a gene is involved in preventing a
PT   replication error in a cell comprises providing a specific inhibitor for
PT   the product and determining the level of expression of a marker gene.
XX
PS   Example 1; Fig 3; 47pp; English.
XX
CC   The specification describes a method for determining whether a product of
CC   a gene is involved in preventing a replication error in a cell. The
CC   method comprises providing the cell with a specific inhibitor for the
CC   product and determining the level of functional expression of a marker
CC   gene in the cell, where the level of expression of the marker gene is
CC   dependent on the occurrence of the replication error. The method is used
CC   for determining whether a product of a gene is involved in preventing a
CC   replication error in a cell. The identified genes are useful for
CC   developing diagnostic tools, or as targets for drug development to
CC   manipulate cells on the basis of the presence or absence of function of
CC   the gene. ABZ23535-36 represents fragments of plasmids used to detect
CC   somatic instability, in the course of the invention

XX
PS Example 2; Col 34; 36pp; English.
XX
CC This invention relates to nucleic acid molecules encoding portions of the
CC human endometrial specific steroid-binding factors I, II, and III. Also
CC included in the invention are hESF I, II, and III polypeptide sequences.
CC The nucleotide sequence exhibit antiasthmatic, antiinflammatory,
CC antiallergic, and cytostatic properties. The polynucleotides are used in
CC gene therapy to express hESF I, II and III polypeptides in vivo to treat
CC and/or prevent inflammation, asthma, rhinitis, cystic fibrosis, air way
CC disease, neoplasia and atopy. The polynucleotides are also used to
CC inhibit phospholipase A2 activity, bind polychlorinated biphenyls, reduce
CC foreign protein antigenicity, inhibit monocyte and neutrophil chemotaxis
CC and phagocytosis, inhibit platelet aggregation, regulate eicosanoid
CC levels in the human uterus and control the growth of endometrial cells.
CC The polynucleotides are also useful for detecting complementary
CC polynucleotides as a diagnostic reagent. The hESF I, II and III
CC polynucleotides are used to detect complementary polynucleotides such as
CC a diagnostic reagent. Detection of a mutated form of hESF I, II and III
CC associated with a dysfunction will provide a diagnostic tool that can
CC define diagnosis of a disease or susceptibility to a disease which
CC results from under-expression, over-expression or altered expression of
CC hESF I, II and III e.g. a susceptibility to inherited asthma and
CC endometrial cancer. They are also useful for chromosome identification.
CC The present sequence represents a PCR primer used to amplify the hESF I
CC cDNA sequence

PT New antibody specific for human endometrial specific steroid-binding
PT factor (hESF) III, useful for detecting hESF III protein in biological
PT sample and to isolate or identify clones expressing the protein.

XX
PS Example 2; Col 33; 36pp; English.
XX
CC PCR primers ABL41790 and ABL41793 were used to amplify cDNA encoding
CC human endometrial specific steroid-binding factor (hESF) I. The primers
CC were used to introduce restriction sites for cloning. The full length
CC hESF I protein has a molecular weight of 9.8 kDa. The protein has
CC homology to rat prostatic steroid-binding protein. Antibodies which bind
CC hESF proteins, such as hESF I, hESF II, and hESF III are useful for
CC isolating or to identify clones expressing the polypeptides or to purify
CC the polypeptides by affinity chromatography. Agonists and antagonists of
CC hESF proteins are useful for treating and/or preventing susceptibility to
CC asthma

PT New human endometrial specific steroid-binding factor (hESF) proteins and
PT genes, useful for treating or diagnosing a disease or susceptibility to a
PT disease, particularly asthma.
XX
PS Example 2; Page 18; 37pp; English.
XX
CC The invention discloses isolated polypeptides, which comprise human
CC endometrial specific steroid-binding factors I, II and III (hESF I, II
CC and III), and the nucleic acids encoding them. The hESF polypeptide has
CC homologies to mammalian Clara cell 10 kDa (CC10) secretory protein and
CC rat prostatic steroid-binding protein which are factors which modulate or
CC mediate the action of hormones involved in the regulation of functions of
CC the lung and uterus. The nucleic acids and polypeptides can be used to
CC identify compounds that bind to and inhibit activation, raise antibodies
CC or develop antagonists against the isolated hESF polypeptide. The
CC polypeptides or polynucleotides are useful for treating a patient having
CC a need of hESF I, hESF II, hESF III or for treating a patient having a
CC need to inhibit hESF. The polypeptide is administered by providing to the
CC patient the DNA encoding the hESF polypeptide in vivo (gene therapy). In
CC particular, the disease is asthma. The hESF polypeptides or
CC polynucleotides are also useful for diagnosing a disease or a
CC susceptibility to the disease. The sequence presented is the 3' PCR
CC primer which was used to amplify hESF I cDNA for expression using
CC baculovirus expression system T

PT Array containing probes for genes involved in mitochondrial biology,
PT useful for determining mitochondrial biology gene expression profiles for
PT use in diagnosing pathologies and identifying biochemical pathways.
XX
PS Claim 2; SEQ ID NO 3014; 201pp; English.
XX
CC The invention relates to a novel array comprising at least two isolated
CC nucleotide molecules, each molecule having a sequence capable of uniquely
CC hybridising to a nucleic acid molecule which is an expression product of
CC a gene involved in mitochondrial biology. The array comprises two or more
CC isolated nucleic acid molecules or spots, each molecule having a sequence
CC chosen from sequence of 994 human probes and 2046 mouse probes. An array
CC of the invention is useful for determining an expression profile of a
CC mouse or human sample containing nucleic acid, by contacting the array
CC with the sample under conditions allowing selective hybridisation, and
CC measuring hybridisation of nucleic acid in the sample to the array to
CC produce an expression profile. The array is also useful for determining
CC an expression profile of a first labelled sample containing nucleic acid
CC relative to a second, differently labelled sample containing nucleic
CC acid. The second sample is a reference or a standard. An array is useful

CC for determining an expression profile diagnostic of an energy-metabolism-
CC related physiological condition. An array of the invention is useful for
CC determining mitochondrial biology gene expression profiles of organisms,
CC such as human, mice and closely related species, tissue and organs of
CC such organisms, which are useful for determining expression profiles
CC diagnostic of energy metabolism-related physiological conditions,
CC diagnosing such physiological conditions, identifying biochemical
CC pathways, genes, and mutations involved in such physiological conditions,
CC identifying therapeutic agents useful for preventing and/or treating such
CC physiological conditions, evaluating and/or monitoring the efficacy of
CC such therapies, and creating and identifying animal models of human
CC energy metabolism-related physiological conditions. An array is also
CC useful for defining expression signatures or profiles for mitochondrial
CC diseases, as well as distinguishing clinical disorders that result from
CC oxidative phosphorylation (OXPHOS) dysfunction, oxidative stress,
CC apoptosis and aging. An array of the invention contains probes of genes
CC not previously recognised to participate in mitochondrial biology. The
CC sequences shown in ADD33224-ADD35260 represent murine mitochondrial DNA
CC clones used to make the probes of the invention. Some sequences are not
CC present, these are SEQ ID NO's 295, 1174, 1213, 1700, 1728, 1730, 1905,
CC 1906, 2408 and 2643.

PT Identifying compounds which modulate activity of target biomolecules,
PT used to provide compounds which can be used as pharmacological,
PT agricultural and industrial compounds.
XX
PS Example 8; Fig 135; 405pp; English.
XX
CC This invention describes a novel method for identifying compounds which
CC modulate the activity of a target biomolecule. The method uses 3-
CC dimensional representations of the biomolecule and a library of compounds
CC and comprises (a) identifying at least one molecular interaction site of
CC the target RNA; (b) generating in silico a virtual library of compounds
CC predicted or calculated to interact with the molecular interaction site;
CC and (c) comparing 3-dimensional (3-D) representations of the target RNA
CC with members of the virtual library of compounds to generate a hierarchy
CC of the compounds ranked in accordance with their respective ability to
CC form physical interactions with the molecular interaction site. The
CC method also describes (1) RNA comprising a joined sequence of at least 24
CC nucleotides but not more than 70 nucleotides and having secondary
CC structure defined by: (a) 3 nucleotides forming a first side of a first
CC double stranded (ds) region; (b) 2 nucleotides forming a first side of an
CC internal loop region; (c) 4 nucleotides forming a first side of a second
CC ds region; (d) 4 or 5 nucleotides forming an end loop region; (e) 4
CC nucleotides forming a second side of the second ds region; (f) 4
CC nucleotides forming a second side of the internal loop region; and (g) 3
CC nucleotides forming a second side of the first ds region; (2) a purified
CC and isolated RNA fragment comprising the human sequence
CC UUUACAACAUAAUCUAGUUUACAGAAAAAUC (II). The methods and products can be
CC used for identifying agents which modulate the activity of biomolecules,
CC particularly RNA. Such agents can be used as pharmaceutical, agricultural
CC or industrial compounds

XX
CC This invention describes a novel method for identifying compounds which
CC modulate the activity of a target biomolecule. The method uses 3-
CC dimensional representations of the biomolecule and a library of compounds
CC and comprises (a) identifying at least one molecular interaction site of
CC the target RNA; (b) generating in silico a virtual library of compounds

```
CC   predicted or calculated to interact with the molecular interaction site;
CC   and (c) comparing 3-dimensional (3-D) representations of the target RNA
CC   with members of the virtual library of compounds to generate a hierarchy
CC   of the compounds ranked in accordance with their respective ability to
CC   form physical interactions with the molecular interaction site. The
CC   method also describes (1) RNA comprising a joined sequence of at least 24
CC   nucleotides but not more than 70 nucleotides and having secondary
CC   structure defined by: (a) 3 nucleotides forming a first side of a first
CC   double stranded (ds) region; (b) 2 nucleotides forming a first side of an
CC   internal loop region; (c) 4 nucleotides forming a first side of a second
CC   ds region; (d) 4 or 5 nucleotides forming an end loop region; (e) 4
CC   nucleotides forming a second side of the second ds region; (f) 4
CC   nucleotides forming a second side of the internal loop region; and (g) 3
CC   nucleotides forming a second side of the first ds region; (2) a purified
CC   and isolated RNA fragment comprising the human sequence
CC   UUUACAACAUAAUCUAGUUUACAGAAAAAUC (II). The methods and products can be
CC   used for identifying agents which modulate the activity of biomolecules,
CC   particularly RNA. Such agents can be used as pharmaceutical, agricultural
CC   or industrial compounds

PT   New oligo:nucleotide clamps that stably bind to target polynucleotide(s)
PT   - may be used in diagnosis and therapy to inhibit genes or mRNA of, e.g.,
PT   herpes:virus, HIV, oncogene(s), etc.
XX
PS   Example 10; Page 28; 44pp; English.
XX
CC   The oligonucleotide clamps AAQ85069 and AAQ85070 are specific for a ss,
CC   or ds target nucleotide. When bound to the target sequence the two
CC   oligonucleotides form a stable non-covalent link, clamping the target
CC   sequence. This technique may be used to inhibit the expression, or
CC   function of an exogenous gene in a host (pref. human). The gene may be
CC   from herpes virus, cytomegalovirus, human papilloma virus, HIV or an
CC   oncogene. Therefore the clamps may be used in the treatment and diagnosis
CC   of human viral diseases. (Updated on 25-MAR-2003 to correct PN field.)

XX
CC   This sequence represents an oligonucleotide clamp which was used to bind
CC   a target sequence comprising a segment of the HIV pol and nef genes in
CC   single stranded or double stranded forms. An oligonucleotide clamp is a
CC   compound capable of forming a covalently closed macromolecule or a stable
CC   circular complex after specifically binding to the target polynucleotide.
CC   The hinge region of this molecule comprises free amines. Oligonucleotide
CC   clamps generally comprise one or more oligonucleotide moieties capable of
CC   specific binding to the target molecule and one or more pairs of binding
CC   moieties covalently linked to the oligonucleotide moieties. Upon
CC   annealing of the oligonucleotides moieties to the target polynucleotide,
CC   the binding moieties of a pair are bought into juxtaposition so that they
CC   form a stable covalent or non-covalent linkage or complex. The
CC   interaction of the binding moieties effectively clamps the specifically
CC   annealed oligonucleotide moieties to the target polynucleotide. (Updated
CC   on 25-MAR-2003 to correct PN field.)

PT   autoimmune disorders.
XX
PS   Example 4; Page 121; 157pp; English.
XX
CC   The invention relates to a composite binding polypeptide comprising a
CC   first natural binding domain derived from a first natural binding
CC   polypeptide and a second natural binding domain derived from a second
CC   natural binding polypeptide, where the first and second natural binding
CC   polypeptides may be the same or different and where the polypeptide binds
CC   to a target differing from the natural target of both the first and
CC   second binding polypeptides. The invention also relates to a chimeric
CC   polypeptide comprising a binding polypeptide cited above and a biological
CC   effector domain, a library of natural binding domains, a library of
CC   natural zinc finger nucleic acid binding domains comprising a linker
CC   attached to it, a method for selecting a binding polypeptide capable of
CC   binding to a target site and a method for designing a composite binding
CC   polypeptide. The methods and compositions of the present invention are
CC   useful for designing sequence-specific binding proteins for regulation of
CC   gene expression in the fields of molecular biology. They can also be used
CC   for the diagnosis and treatment of autoimmune disorders, and as research
CC   tools and in transgenic animals. This sequence represents human zinc
CC   finger binding motif DNA used in the scope of the invention

PT   Determining the concentration of a target nucleic acid, useful e.g. for
PT   detecting genetic mutations, comprises using a fluorescently labeled
PT   probe in which emission is reduced by binding to the target nucleic acid.
XX
PS   Example 5; Page 21; 55pp; English.
XX
CC   The invention relates to the determination of the concentration of a
CC   nucleic acid target, using a fluorescently labeled probe which produces
CC   reduced fluorescence emission when hybridised to the target nucleic acid.
CC   The method comprises measuring the reduction in emission caused by
CC   hybridisation. The new method is particularly used to quantify target
CC   nucleic acids by a real-time polymerase chain reaction, e.g. for
CC   quantifying microbial cells in co-cultures or symbiotic systems, for
CC   detecting gene mutations or polymorphisms, and for analysing melting
CC   curves of target nucleic acids to determine a Tm value. Methods of the
CC   invention allow target nucleic acids to be quantified quickly, easily and
CC   accurately. Particularly there is no need to remove unbound probe, and no
CC   materials are introduced that inhibit amplification by Taq polymerase (so
CC   conventional PCR conditions can be used). The specificity of PCR is kept
CC   high (amplification of primer dimers is delayed), and the limit of
CC   quantitation is reduced. Complex probes are not needed, and amplification
CC   can be monitored in real time. The working graph for data analysis
CC   (automatically generated by a computer) has a higher correlation
CC   coefficient than conventional graphs so more accurate quantitation is
CC   possible. The current sequence represents a synthetic
CC   deoxyribooligonucleotide that was used for investigating the base
CC   selectivity of a target nucleic acid

PT   probe in which emission is reduced by binding to the target nucleic acid.
XX
PS   Example 5; Page 21; 55pp; English.
XX
CC   The invention relates to the determination of the concentration of a
CC   nucleic acid target, using a fluorescently labeled probe which produces
CC   reduced fluorescence emission when hybridised to the target nucleic acid.
CC   The method comprises measuring the reduction in emission caused by
CC   hybridisation. The new method is particularly used to quantify target
CC   nucleic acids by a real-time polymerase chain reaction, e.g. for
CC   quantifying microbial cells in co-cultures or symbiotic systems, for
CC   detecting gene mutations or polymorphisms, and for analysing melting
CC   curves of target nucleic acids to determine a Tm value. Methods of the
CC   invention allow target nucleic acids to be quantified quickly, easily and
CC   accurately. Particularly there is no need to remove unbound probe, and no
CC   materials are introduced that inhibit amplification by Taq polymerase (so
CC   conventional PCR conditions can be used). The specificity of PCR is kept
CC   high (amplification of primer dimers is delayed), and the limit of
CC   quantitation is reduced. Complex probes are not needed, and amplification
CC   can be monitored in real time. The working graph for data analysis
CC   (automatically generated by a computer) has a higher correlation
CC   coefficient than conventional graphs so more accurate quantitation is
CC   possible. The current sequence represents a synthetic
CC   deoxyribooligonucleotide that was used for investigating the base
CC   selectivity of a target nucleic acid

XX
CC The present invention relates to nucleic acid probes, which are useful
CC for assaying nucleic acids by hybridising with a target nucleic acid, in
CC which a single-stranded oligonucleotide is labelled with a fluorescent
CC substance and a quencher in a manner that the fluorescence intensity of
CC the hybridisation reaction system is increased after completion of the
CC hybridisation but no stem loop structure is formed. The probes are useful
CC for assaying nucleic acids and their polymorphism and mutation,
CC particularly useful for e.g. analytical applications, disease diagnosis
CC and microbial identification. The present sequence was used to illustrate
CC the invention

PT Hairpin sensor useful for detecting a target nucleotide sequence in a
PT sample, comprises a hairpin loop assembly including a complementary probe
PT and a quenchable fluorescing agent.
XX
PS Example 3; Page 11; 16pp; English.
XX
CC The invention discloses a hairpin sensor comprising a hairpin loop
CC assembly including a complementary probe positioned between a first
CC inverse repeat arm and a second inverse repeat arm, and a quenchable
CC fluorescing agent joined, directly or indirectly, to the end of the
CC second inverse repeat arm of the hairpin loop assembly opposite the
CC complementary probe. Also claimed is a microarray comprising the hairpin
CC sensor, where the end of the first inverse repeat arm opposite the
CC complementary probe is bound, directly or indirectly, to a support, a kit
CC for detecting a target nucleotide sequence in a sample comprising the
CC hairpin sensor, and a support, and a hairpin sensor system, in which the
CC particle is conductive or semi-conductive, including at least one of the
CC above hairpin sensor assemblies. The hairpin sensor further comprises a
CC functional group joined to the end of the first inverse repeat arm
CC opposite the complementary probe, or first spacer opposite the first
CC inverse repeat arm, the functional group selected from amino, carboxyl,
CC thiol and hydroxyl. Further, the sensor comprises a ligand positioned
CC between the second inverse repeat arm and the quenchable fluorescing
CC agent, where the ligand is selected from mercapto, hydroxyl, amino,
CC nitrile and carboxyl, carboxylic acid, organic acid and amino acid. The
CC second spacer is positioned between the second inverse repeat arm and the
CC quenchable fluorescing agent which comprises a semiconductor nanocrystal
CC or rhodamine B-labelled dye. Within the microarray the support is capable
CC of accepting a charge. At least one hairpin sensor comprises two or more
CC hairpin sensors. The two or more hairpin sensors include complementary
CC probes that are the same or different and respective quenchable
CC fluorescing agents that are the same or different. The two or more
CC hairpin sensors are arranged in a spatially-defined pattern. The sensor
CC and system are useful for detecting a target nucleotide sequence in a
CC sample. Further, the method involves identifying the target nucleotide
CC sequence by the location of the complementary probe to which the target
CC nucleotide sequence binds. The two or more hairpin sensors include
CC complementary probes or quenchable fluorescing agents, that are
CC different. The sequence presented is the hairpin oligonucleotide, #2,
CC used in an example of the invention.

PT   Generating mutation in gene using cells which contain defective mismatch
PT   repair gene, useful to generate genetically altered mutations with new
PT   output traits.
XX
PS   Example 5; Fig 7; 59pp; English.
XX
CC   The patent discloses a method for generating hypermutable organisms.
CC   Dominant negative alleles of human mismatch repair genes can be used to
CC   generate hypermutable cells and organisms. They increase the rate of
CC   spontaneous mutations by reducing the effectiveness of DNA repair and
CC   thereby render the cells or animals hypermutable. The method is used to
CC   produce genetically altered organisms to produce new output traits. The
CC   present sequence is a bacterial poly purine nucleotide phosphorylase
CC   (polyPNP) DNA fragment containing an in-frame polyA tract. This sequence
CC   is used in the exemplification of the invention

PT   Polymerase chain reaction and primers for detecting nucleic acids from
PT   the diabetogenic coxsackie B virus-4 strain VD2921.
XX
PS   Example 5; Page 44; 79pp; English.
XX
CC   The invention describes a polymerase chain reaction (PCR) and primers for
CC   detecting nucleic acids from the diabetogenic coxsackie B virus-4 (CBV-4)
CC   strain VD2921, (particularly VP1, VP2, VP3, VP4, P2A, P2B, P2C, P3A, P3B,
CC   P3C and P3D nucleic acids). The methods and primers are used for the
CC   detection of CBV-4 strain VD2921 which is associated with diabetes
CC   (diabetogenic enterovirus). Early detection of the diabetes e.g.
CC   detection of diabetogenic enteroviral RNA in peripheral mononuclear
CC   cells, can improve prognosis by allowing treatment e.g. with antiviral
CC   drugs, to prevent further loss of beta cells and severe long term
CC   consequences of diabetes including blindness, renal failure and leg
CC   amputations. This sequence represents a primer used to determine the
CC   genomic structure of diabetogenic coxsackie B virus 4 (CBV-4) strain
CC   VD2921

PT Detecting an analyte in a sample comprises providing nucleic acid
PT sequence which is catalytically active in presence of analyte, contacting
PT catalytic nucleic acid with substrate and amplifying catalytic product.
XX
PS Disclosure; Page; 36pp; English.
XX
CC The invention relates to a method of detecting an analyte in a sample.
CC The method comprises providing a nucleic acid sequence which is initially
CC catalytically inactive, but which becomes catalytically active in the
CC presence of an analyte (the effector); providing a nucleic acid substrate
CC for the catalytic activity of the nucleic acid sequence; and contacting
CC the nucleic acid sequence and the substrate with the sample under
CC conditions allowing catalytic activity of nucleic acid sequences. The
CC catalytic nucleic acid sequence will be able to convert the nucleic acid
CC substrate into a nucleic acid product only if the analyte of interest is
CC present. The nucleic acid catalytic product is then amplified, and a
CC significant increase in the amount of product indicates the presence of
CC the analyte in the sample. The method is useful for the qualitative or
CC quantitative determination of an analyte in a sample in diagnostic
CC assays. The invention describes the in vitro selection of a ribozyme
CC ligase (L1; AAA57859, AAA57860) which is catalytically active only in the
CC presence of an oligonucleotide effector (AAA57854). The L1 ribozyme
CC ligase was selected from a pool of RNA molecules comprising a central
CC randomised region 90 nucleotides in length flanked on both sides by
CC constant sequence regions (the N90 RNA pool; AAA57851). In the presence
CC of the effector, selection was performed using one of the tagged
CC substrate molecules AAA57855-A57857. RNAs with ligase activity (i.e.,
CC those which have become ligated to the substrate molecule) were reverse
CC transcribed using the effector oligo, and then PCR amplified using the
CC effector and a DNA primer identical in sequence to the substrate used for
CC the selection. A ribozyme ligase, L1, was selected via this procedure. L1
CC can only adopt its active conformation (AAA57859) in the presence of the
CC effector oligo (analyte). In the absence of the effector, L1 adopts an
CC inactive conformation (AAA57860). The present sequence represents the
CC deoxy-T22-tagged substrate oligonucleotide. The dT22 tag enables
CC successfully ligated products to be isolated using oligo(dA) cellulose
CC Type 7. Note: The present sequence is not given in the specification, but
CC is created from the inforamtion given on page 11

PS Claim 3; Page 1; 12pp; Chinese.
XX
CC The present invention relates to the preparation of a vaccine against
CC Japanese schistosomiasis. The vaccine comprises a gene encoding a fatty
CC acid binding protein (FABP). The FABP is expressed in a Bombyx mori
CC system as a fusion protein of 18kD. The fusion protein has an increased
CC immunogenicity and stronger anti-infective action than the wild-type
CC protein. The present sequence represents a PCR primer used to amplify DNA
CC encoding the FABP of the invention

PT   Selective elimination of non-targeted DNA sequences for rapid isolation
PT   and enrichment of the differences of DNA fragments between two pools of
PT   DNA, comprises converting testers to drivers.
XX
PS   Claim 6; Col 5; 23pp; English.
XX
CC   The invention comprises rapid isolation and enrichment of the differences
CC   of DNA fragments between two pools of DNA, comprises converting
CC   undesirable testers (DNA being subtracted) to drivers (DNA used to
CC   subtract) and re-utilising converted drivers in repeats of subtraction to
CC   achieve double exponential elimination of undesirable tester sequences.
CC   The method comprises (a) attaching a nucleic acid fragment to 1 or more
CC   polymerase chain reaction (PCR) adapters to form an adapter-attached
CC   nucleic acid fragment, followed by amplifying the adapter-attached
CC   nucleic acid fragment through PCR with primers containing nucleic acid
CC   sequences complementary to nucleic acid sequences of the adapter to form
CC   an adapter-attached nucleic acid tester, (b) mixing the adapter-attached
CC   nucleic acid tester with a nucleic acid driver that contains no attached
CC   adapter or contains an attached adapter whose sequence differs from the
CC   adapter, to form a nucleic acid mixture, (c) denaturing and re-annealing
CC   the tester/driver nucleic acid mixture, (d) adding to the nucleic acid
CC   mixture an effective amount of reagents necessary for removing the
CC   adapter sequence from the tester/ driver hetero-duplex and (e) repeating
CC   step (c) to (d) at least once (no amplification takes place and no
CC   additional driver is added). The method is used for rapid isolation and
CC   enrichment of the differences of DNA fragments between two pools of DNA
CC   e.g. in the search for tumour specific sequences. The method has 2
CC   improvements over the methods disclosed by Yang et al. (1996), Lisitsyn
CC   et al. (1993), Straus et al. (1990) by (i) bypassing the need of a
CC   polymerase chain reaction (PCR) amplification or physical separation of
CC   desirable testers from undesirable ones in each repeat of subtraction, it
CC   eliminates the necessity of tester dilution in each repeat of
CC   subtraction, and (ii) by utilising the convened driver from each repeat
CC   of subtraction, it eliminates the need for re-introducing additional
CC   driver into hybridisation in each repeat of subtraction. The present
CC   sequence is an Oligo D(T) PCR primer used in the method of the invention

PT   Depositing nucleic acid on substrate by direct-write nanolithography, by
PT   positioning nanoscopic tip relative to substrate, to transfer nucleic
PT   acid to substrate and generate stable nucleic acid nanoscale pattern.
XX
PS   Disclosure; Page 38; 76pp; English.
XX
CC   The invention relates to a method of depositing nucleic acid onto a
CC   substrate by direct-write nanolithography, by positioning at least one
CC   nanoscopic tip relative to a substrate so that the tip and substrate
CC   approach each other, and the nucleic acid is transferred from the tip to
CC   the substrate to generate a stable nucleic acid nanoscale pattern on the
CC   substrate which is hybridizable with complementary nucleic acid. The
CC   method is useful for generating nanoscale patterns of nucleic acid on a
CC   substrate, in which before transfer the tip is modified to allow the
CC   nucleic acid to wet the tip and the nucleic acid is modified to chemisorb
CC   or covalently bond to the substrate upon transfer. The method is also
CC   useful for direct patterning of modified nucleic acid onto a substrate,
CC   by inking a scanning probe microscopic tip with a modified nucleic acid
CC   and positioning the inked tip close enough to the substrate to effect
CC   transfer of the nucleic acid to the substrate to form a nanoscale
CC   pattern. Another use for the method is for assembling nanoparticles (e.g.
CC   gold nanoparticles) to form nanoscale patterns, by depositing from a
CC   nanoscopic tip a first nucleic acid onto a substrate to form a deposit
CC   with lateral nanoscale features of 1000 mm or less by direct write
CC   nanolithography, hybridizing the nucleic acid deposit with the
CC   nanoparticle, where the nanoparticle is functionalized with a second
CC   nucleic acid which is either complementary to the first or complementary
CC   to the nucleic acid of a linking strand which links the second nucleic
CC   acid to the first. Deposition of nucleic acid on the substrate is
CC   repeated to form a nanoarray of the nucleic acid and the hybridization is
CC   carried out with the nanoarray. The method is suitable for writing
CC   preconceived nanoscale features directly, without use of expensive and
CC   potentially destructive methods such as electron beam and
CC   photolithographic methods. The structures can be built up, if desired,
CC   without degrading existing structures. Complicated stamps and resists are
CC   not needed. Improvements in the consistency and stability of the
CC   nanolithography can be observed. This sequence represents an example of a
CC   nucleic acid that can be used in the method of the invention.

PS   Example 1C; Page 118; 122pp; English.
XX
CC   The patent discloses novel human phosphodiesterase (PDE), zcytor13 cDNA
CC   and its corresponding protein. Zcytor13 protein is used to promote wound
CC   healing in tissues, to exhibit anti-bacterial and anti-viral effects and
CC   to identify modulators (e.g. agonists or antagonists). Zcytor13, its
CC   agonists or antagonists are useful in the treatment of inflammatory heart
CC   or cardiovascular conditions, muscle inflammation, inflammation during
CC   and after surgery, arthritis, asthma, inflammatory bowel disease or
CC   diverticulitis, for modulating spermatogenesis, sperm capacitation, as
CC   immunocontraceptive or anti-fertility vaccine and for treating male
CC   infertility. Zcytor13 protein and its antibodies are used to diagnose
CC   cancer, reperfusion ischaemia, asthma, psoriasis and melanoma. Zcytor13
CC   proteins are used to enhance fertilisation. Zcytor13 antagonists are used
CC   to treat myocarditis, atherosclerosis, pelvic inflammatory disease (PID),
CC   psoriasis, eczema, scleroderma and other inflammatory diseases. Zcytor13
CC   sequences and/or its antibodies are useful for treatment of disorders
CC   associated with vasoconstriction, heart arrhythmia, congestive heart
CC   disease, muscle spasms and fatigue. They are used for detecting human
CC   chromosomal abnormalities. Zcytor13 cDNAs are used in gene therapy.
CC   Zcytor13-cytokine fusion proteins or antibody-cytokine fusion proteins
CC   are useful for enhancing in vivo killing of target tissue. The present
CC   sequence is a polyA PCR primer, ZC7764b which is used to isolate full
CC   length zcytor13 cDNA by screening human placental cDNA library

PT   Novel secreted salivary protein, zsig63 and polynucleotide encoding it
PT   useful for treating microbial infections, inflammatory conditions, dental
PT   caries and lung infections associated with cystic fibrosis.
XX
PS   Example 1; Page 29; 33pp; English.
XX
CC   The present invention relates to a new secreted salivary protein, zsig63.
CC   The invention is useful for detecting in a test sample, the presence of
CC   an antagonist or agonist of zsig63 protein activity. The invention is
CC   also useful as an immunogen for producing an antibody to zsig63
CC   polypeptide. zsig63-cytokine fusion proteins or antibody-cytokine fusion
CC   protein are useful for enhancing in vivo killing of target tissues.
CC   Pharmaceutical composition comprising purified zsig63 polypeptide are
CC   useful in the treatment of conditions associated with pathological
CC   microbes, including bacterial, fungal and viral infections. High
CC   expression of zsig63 in salivary gland suggests that anti-microbial
CC   polypeptides are useful for treatment of dental caries (tooth decay),
CC   periodontal disease, thrush and gastrointestinal disease. Other
CC   applications can be used in urinary tract infections, vaginal infections,
CC   prevention of infection in skin and other epithelial wounds. The
CC   polypeptides can be used to establish normal microflora and protect
CC   against pathogenic colonisation and invasion. The invention is useful
CC   when pro-inflammatory activity is desired. Applications for such pro-
CC   inflammatory activity include the treatment of chronic tissue damage,
CC   particularly in areas having a limited or damaged vascular system e.g.,
CC   damage in extremities associated with diabetes. Antagonists to zsig63
CC   polypeptides may be useful as anti-inflammatory agents. The invention is
CC   useful for the treatment of patients having incompetent immune system,
CC   such as AIDS (acquired immunodeficiency syndrome) patients or individuals
CC   that have undergone chemotherapy, radiation treatment. The invention is
CC   also useful for the treatment of lung infections associated with cystic
CC   fibrosis and its agonists or antagonists are useful for aiding digestion.
CC   The present nucleic acid sequence represents a PCR primer that was used
CC   in the methods of the invention for identification of zsig63

PT   Novel secreted salivary polypeptide, zsig63, useful as antimicrobial
PT   agent for treating microbial infection, dental carries, periodontal
PT   disease, thrush gastrointestinal disease, and for aiding digestion.
XX
PS   Example 1; Page 30; 33pp; English.
XX
CC   The invention relates to human secreted salivary polypeptide designated
CC   as zsig63 and nucleic acid molecules encoding such polypeptides. zsig63
CC   can be used in detecting agonists and antagonists of its activity, and is
CC   also useful as a host defense polypeptide, immune modulating factor,
CC   antipathogenic polypeptide, cell-cell signalling molecule, growth factor,
CC   cytokine, or as secreted extracellular matrix associated proteins with
CC   growth factor hormone activity. It is useful for treating conditions
CC   associated with pathological microbes, including bacterial, fungal and
CC   viral infections, for treating dental carries (tooth decay), periodontal
CC   disease, thrush and gastrointestinal disease, for treating urinary tract
CC   infection, vaginal infection and for preventing infection in skin and
CC   other epithelial wounds. zsig63 is useful for establishing normal
CC   microflora and protect against pathogenic colonisation and invasion, for
CC   treating chronic tissue damage e.g. damage in extremities associated with
CC   diabetes and useful as anti-inflammatory agents. It is useful as a marker
CC   of lung dysfunction, salivary gland dysfunction, or dysfunction of
CC   prostate gland. It is also therapeutically useful for aiding digestion.
CC   Polynucleotides of the invention are used in gene therapy for increasing
CC   or inhibiting zsig63 activity, for detecting abnormalities on human
CC   chromosome 4 associated with disease or other human traits and as
CC   diagnostics in forensic DNA profiling. Sequences of the invention are
CC   useful for stimulating proliferation or differentiation of cardiac
CC   myocytes, for proliferation or differentiation of adipocytes and for
CC   inhibiting chondrosarcomas, atherosclerosis, restenosis and obesity. The
CC   present sequence is a primer used in the identification of human zsig63
CC   DNA

PT   New zalpha11 ligand polypeptides and polynucleotides, useful for
PT   stimulating proliferation, activation, differentiation and/or induction
PT   of inhibition of specialized cell function, or for stimulating an
PT   antigenic response.
XX
PS   Example 7; Col 139; 105pp; English.
XX
CC   The present invention relates to the isolation of a novel cytokine,
CC   zalpha11 Ligand and the polynucleotide encoding it. The invention also
CC   gives the sequence for the zalpha11 receptor and the polynucleotide
CC   encoding it. The zalpha11 Ligand polypeptide stimulates proliferation of
CC   natural killer (NK) cells or NK cell progenitors, the activation of NK
CC   cells, proliferation of T-cells, proliferation of B-cells stimulated with
CC   anti-CD40 antibodies, stimulates an antigenic response in a mammal, and
CC   reduces proliferation of B-cells stimulated with anti-IgM antibodies. The
CC   zalpha11 Ligand polypeptide is also useful in preparing antibodies that
CC   bind to zalpha11 Ligand epitopes. The zalpha11 Ligand polynucleotides can
CC   be used as probes or primers to clone regions of a zalpha11 Ligand gene,
CC   and in gene therapy. Zalpha11 Ligand may also be used to identify
CC   inhibitors of its activity, to enhance the generation of anti-tumour
CC   responses with or without the infusion of donor lymphocytes, and to
CC   activate or stimulate the immune system. The present sequence represents
CC   a sequencing primer used to sequence cDNA clones in the isolation of
CC   human zalpha11 Ligand

PT   Novel isolated zsig63 polypeptide, member of the adhesin family, useful
PT   for treating dental carries, periodontal disease, thrush,
PT   gastrointestinal disease, urinary tract infections, vaginal infections,
PT   skin infections.
XX
PS   Example 1; Page 29; 32pp; English.
XX
CC   The invention relates to an isolated zsig63 polypeptide comprising at
CC   least 90% identity to an amino acid sequence which comprises domain 1 of
CC   zsig63, domain 2, domain 3, mature zsig63 and full length zsig3. Also
CC   included are the polynucleotide encoding zsig63, a zsig63 expression
CC   vector, a cultured cell comprising the vector and expressing the protein,
CC   a DNA encoding a fusion protein (comprising amino acids 1-15, 16-37, 38-
CC   126, 127-219 or 16-219 of zsig63 and an additional protein), using a
CC   zsig63 reporter gene construct to identify zsig63 agonists, and producing
CC   an anti-zsig63 antibody using zsig63 immunogenic peptides, Zsig63 is
CC   useful for detecting in a test sample, the presence of antagonist of
CC   zsig63 protein activity. Zsig63 has antimicrobial activity and since
CC   exhibits high expression in salivary gland, can be used for treating
CC   dental carries, periodontal disease, thrush, and gastrointestinal
CC   disease, urinary tract infections, vaginal infections, skin infections
CC   and other epithelial wounds. The polypeptides can be used to establish
CC   normal microflora and protect against pathogenic colonization and
CC   invasion. Zsig63 can also be used for providing pro-inflammatory activity
CC   for treating chronic, tissue damage particularly in areas having limited
CC   or damaged vascular system, e.g. in diabetes, and for treating
CC   immunocompromised AIDS patients or in individuals that have undergone
CC   chemotherapy, radiation treatment, for treating lung infections e.g. in
CC   cystic fibrosis. Detection of zsig63 polypeptide at relatively high
CC   levels in the trachea may indicate that such polypeptides may serve as a
CC   marker of lung dysfunction. Zsig63 is also useful in diagnosing
CC   conditions associated with salivary gland or lung dysfunction including
CC   salivary gland carcinoma, Pneumocystis carinii infection, emphysema,
CC   chronic bronchitis, prostate dysfunctions such as prostate
CC   adenocarcinoma, aiding digestion, and as components of defined cell
CC   culture media and may be used to replace serum that is commonly used in
CC   culture. The DNA is useful in gene therapy applications to increase or
CC   inhibit zsig63 activity, and for detecting abnormalities on human
```

```
CC   chromosome 4 (e.g. 4q12-4q13, associated with dentinogenesis imperfecta,
CC   and dentin dysplasia type II). Zsig63 is an adhesin family member. The
CC   present sequence is a primer used to isolate and sequence nucleic acdis
CC   encoding human zsig63

PT   Detecting target nucleic acid molecules - using excess complementary
PT   nucleic acid probes and nicking to complete a cycling sequence.
XX
PS   Disclosure; Page 24; 34pp; English.
XX
CC   Probe MRCO59 is bound by a hydrolysable linkage to a solid support at its
CC   3' end. It is used by reacting excess probe with a target nucleic acid;
CC   nicking hybridised probe at least once within a predetermined sequence to
CC   form 2 or more probe fragments hybridised to the target sequence, which
CC   results in the probe fragments becoming hybridised to another probe; and
CC   identifying probe fragments, so detecting the target sequence. The probe
CC   can react with target sequence to complete a cycling sequence. Using this
CC   system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can
CC   be obtd. The probe is cleavable at the ribonucleotides by a ds RNase, eg
CC   RNase H or ExoIII. (Updated on 31-OCT-2002 to add missing OS field.)

PS   Disclosure; Page 24; 34pp; English.
XX
CC   Probe MRCO60 is bound by a hydrolysable linkage to a solid support at its
CC   3' end. It is used by reacting excess probe with a target nucleic acid;
CC   nicking hybridised probe at least once within a predetermined sequence to
CC   form 2 or more probe fragments hybridised to the target sequence, which
CC   results in the probe fragments becoming hybridised to another probe; and
CC   identifying probe fragments, so detecting the target sequence. The probe
CC   can react with target sequence to complete a cycling sequence. Using this
CC   system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can
CC   be obtd. The probe is cleavable at the ribonucleotides by a ds RNase, eg
CC   RNase H or ExoIII. (Updated on 31-OCT-2002 to add missing OS field.)
CC   (Updated on 25-MAR-2003 to correct PR field.)

PT   Obtaining single stranded polynucleotide tags from a biological sample,
PT   for analyzing gene expression or diagnosing clinical conditions,
PT   comprises employing nicking endonucleases that cleave complementary
PT   strands.
XX
PS   Example; Page 294; 302pp; English.
XX
CC   The invention relates to a method for obtaining a single stranded
CC   polynucleotide tag from a biological sample by cleaving one of the
CC   complementary strands of a double stranded polynucleotide with a cleavage
CC   agent capable of recognising a double stranded polynucleotide comprising
CC   complementary strands and cleaving only one of the strands of the
CC   polynucleotide in the process of generating a single stranded
CC   polynucleotide tag. The method is useful for separating, analysing,
CC   quantifying or obtaining single stranded polynucleotides comprising tags
CC   originating partly, and preferably wholly from a source of DNA and/or RNA
CC   in a sample comprising biological cells. The method is particularly for
CC   analysing gene expression (expression profiling or differential gene
CC   expression), or in diagnosing clinical conditions. The present sequence
CC   is a primer used in the exemplification of the invention

PT   New oligodeoxynucleic acid molecules useful for the preparation of
PT   vaccine.
XX
PS   Example 8; Page 32; 57pp; English.
XX
CC   The present sequence is that of a thiosubstituted oligodeoxynucleic acid
CC   (ODN) molecule, ODN 24, including deoxyuridine monophosphates. The
CC   invention is based on the discovery that ODNs containing deoxyuridine
CC   residues (U-ODNs) have an immunostimulatory effect comparable to, or in
CC   many instances greater than, ODNs containing CpG motifs, producing higher
CC   numbers of specific T cells to a given antigen. The U-ODNs do not induce
CC   the systemic production of pro-inflammatory cytokines and, in contrast to
CC   CpG ODNs, are not dependent on a specific motif or a palindromic
CC   sequence. Use of a U-ODN for the preparation of a vaccine is claimed.
CC   Combining the U-ODN with an antigen strongly increases the potential of
CC   the antigen to raise the protection/immune response of a vaccinated
CC   individual. An example of the invention demonstrated the generation of a
CC   specific immune response against a melanoma-derived peptide (see
CC   ABP58360) by injection of mice with the peptide in combination with ODN

PT   Improved polymerase thermocycling reaction for nucleic acid
PT   amplification, by thermal cycling of promoter-linked nucleic acid
PT   template synthesis and in vitro transcriptional amplification of nucleic
PT   acid sequences.
XX
PS   Example 4; Page 14; 28pp; English.
XX
CC   The invention relates to an improved polymerase thermocycling reaction
CC   (M1) for linear amplification of nucleic acid sequences, involves
CC   denaturing a number of nucleic acid templates (I), combining the
CC   denatured (I) with a promoter-containing primer (P1), a primer (P2), a
CC   number of deoxynucleotide triphosphates and ribonucleotide triphosphates,
CC   a reverse transcription enzyme, a DNA-dependent DNA polymerase and RNA
CC   polymerase, contacting P1 with (I) to generate a number of promoter-
CC   containing templates, denaturing the promoter-containing templates,
CC   contacting P2 with the denatured promoter-containing templates to
CC   generate a number of promoter-containing double-stranded DNA templates,
CC   where the double-stranded nucleic acid templates are flanked by P1 in one
CC   end and P2 in the other end of the other orientation, transcribing the
CC   promoter-containing double-stranded DNA templates to form a number of
CC   amplified RNA sequences, including the primer region of the promoter-
CC   containing double-stranded DNA templates, contacting the amplified RNA
CC   sequences with P2 to form a number of cDNAs and a number of DNA-RNA
CC   hybrid templates, and denaturing the DNA-RNA hybrid templates. The method
CC   is useful for improved polymerase thermocycling reaction for linear
CC   amplification of nucleic acid sequences, and thus for producing mRNA
CC   expression profile of a cell by M1 to generate multiple copies of the
CC   mRNA. M1 is also useful for determining aberrant protein production of
CC   cells in a diseased state, by generating an expression profile by the
CC   above method, of cells in both normal and diseased states, comparing the
CC   expression profile of the cells in the normal and diseased states,
CC   determining the differences in mRNA composition of the cell(s) in the
CC   diseased state, isolating the mRNA sequences of cell(s) in the diseased
CC   state that differ from mRNA in cell(s) in non-diseased state, amplifying
CC   the isolated mRNA by M1, and determining aberrant protein function of the
CC   protein coded for by the isolated mRNA. M1 is also useful for treating a
CC   cell in a diseased state caused by aberrant protein production, by
CC   determining protein expression of a cell in a diseased state, determining
CC   the mRNA sequence for the aberrant proteins, synthesising an antisense
CC   sequence of the mRNA, amplifying the antisense mRNA sequences by M1, and
CC   delivering a pharmaceutically effective dosage of a composition
CC   comprising the anti-sense mRNA and a compatible lipid based biological
CC   carrier. M1 is also useful for predicting the efficacy of a proposed drug
CC   targeted against an aberrant protein, by determining aberrant protein
CC   production of cell in a diseased state by the above method, amplifying
CC   the aberrant protein by M1 and using recombinant techniques to determine
CC   the effect of proposed drug on the aberrant protein. M1 is also useful
CC   for differential screening of tissue-specific gene expression at a
CC   cellular level, for preparing labeled RNA/DNA probes for a gene chip
```

```
CC   technology, and for determining the efficacy of a drug regiment against a
CC   gene or its cDNAs. The present sequence is an Oligo (dT) primer used to
CC   produce second strand cDNA in the method of the invention

XX
PS   Claim 10; Page 5; 38pp; English.
XX
CC   Novel phosphodiesteric oligonucleotides AAT93811-27 are based on the
CC   generic formula, in the 3'-5' or 5'-3' direction: (GaTa')a''-(GbTb')b''-
CC   (GcTc')c''-(GdTd')d''-(GeTe')e''-(GfTf')f''- (G-gTg')g''-N', where: N and
CC   N' = T or G, equal or different from each other; x = 0-8, equal or
CC   different from each other; a, b, c, d, e, f, and g = 0-10, equal or
CC   different from each other; a', b', c', d', e', f', and g' = 0-30, equal
CC   or different from each other; a'', b'', c'', d'', e'', f'', and g'' = 1-
CC   16, equal or different from each other; The oligonucleotides are believed
CC   to selectively bind and sequester some proteins which are essential to
CC   the viability and growth of tumoural cell line. They have specific and
CC   selective cytotoxic activity against tumour cells, and can be used for
CC   treating tumours of the liquid type, in particular of lymphoblastic
CC   origin, and of solid type, in particular lymphomas. The present
CC   phosphodiester oligonucleotide, at a concentration of 15 micromolar,
CC   reduced growth of CCRF-CEM tumoural cells by 76%, which is detectable 48
CC   hours after administration. (Updated on 25-MAR-2003 to correct PR field.)

PT   Rolling circle synthesis of oligo:nucleotide(s) - using primed circular
PT   template to produce oligonucleotide multimer for cleavage.
XX
PS   Example 2; Col 45; 38pp; English.
XX
CC   The present sequence represents an oligonucleotide used in an example of
CC   the present invention. The present invention describes a method for
CC   synthesising a selected oligonucleotide (I) having well defined ends. The
CC   method comprises: (a) annealing a primer to a single-stranded (ss)
CC   circular template to yield a primed circular template, where the template
CC   comprises: (i) at least one nucleotide sequence complementary to (I); and
CC   (ii) at least one nucleotide effective to produce a cleavage site in the
CC   oligonucleotide multimer; (b) combining the primed circular template with
CC   at least two types of nucleotide triphosphates and a polymerase enzyme
CC   without the addition of auxiliary proteins to yield a ss oligonucleotide
CC   multimer complementary to the circular oligonucleotide template,
CC   comprising multiple copies of (I); and (c) cleaving the oligonucleotide
CC   multimer at the cleavage site to produce (I) having well defined ends.
CC   The method is used for the large-scale synthesis of DNA and RNA oligomers
CC   for use, e.g. as probes and diagnostic agents and/or therapeutic agents

PT   Synthesis of oligo:nucleotide(s) - using a single-stranded circular
PT   oligo:nucleotide template ribonucleotide tri:phosphate(s) and a
PT   polymerase to form multimer(s) which can be cleaved.
XX
PS   Example 2; Page 36; 100pp; English.
XX
CC   The circular template was used for the synthesis of the oligomer dT12 in
CC   an example of the method of the invention for synthesising an RNA
CC   oligonucleotide, comprising combining a single-stranded circular
CC   oligonucleotide template comprising at least one copy of a nucleotide
CC   sequence complementary to the sequence of the desired RNA oligonucleotide
CC   with at least 2 types of ribonucleotide triphosphate and a polymerase
CC   enzyme to yield a single-stranded RNA oligonucleotide multimer
CC   complementary to the circular oligonucleotide template, where the RNA
CC   oligonucleotide multimer comprises multiple copies of the desired RNA
CC   oligonucleotide. The methods can be used for producing RNA
CC   oligonucleotides having a specific sequence and well defined ends. The
CC   RNA oligonucleotides produced can be used as probes, standards and
CC   diagnostic or therapeutic agents. They can be used for modifying the
CC   structure or function of a target molecule. They can also be used to
CC   cleave disease-associated RNA, DNA or protein

PT   Monoclonal antibody specific for PUR protein - useful for treating
PT   cancer.
XX
PS   Example; Col 9; 64pp; English.
XX
CC   The present invention describes a monoclonal antibody that specifically
CC   binds to an epitope of the PUR protein. Antibodies that bind to the PUR
CC   protein and neutralise PUR activity may be used to treat
CC   hyperproliferative diseases such as cancer. PUR antibodies may be used
CC   diagnostically to detect aberrant expression of the PUR protein and/or
CC   mutations in the PUR gene. The present sequence represents a PUR-alpha
CC   RACE primer which is used in an example from the present invention

PT   New detectably labelled oligonucleotide multimer, comprising multiple
PT   contiguous copies of a repeated oligonucleotide - useful for detecting
PT   target molecules in diagnosis and medicinal applications.
XX
PS   Example 2; Page 41; 103pp; English.
XX
CC   The present invention describes a detectably labelled oligonucleotide
CC   multimer, comprising multiple contiguous copies of a repeated
CC   oligonucleotides. The detectably labelled oligonucleotide multimer is
CC   useful for detecting a target molecule. Oligonucleotide multimers may be
CC   produced in sufficient quantity to be useful for diagnostic and medical
CC   applications. The multimers are useful for affinity labelling of
CC   proteins, and for signal amplification in highly sensitive affinity
CC   capture and sequence identification applications. The method provides a
CC   faster, cheaper and simpler way for large-scale production of DNA and RNA
CC   oligomers and multimers. The incorporation of labels enables the
CC   oligonucleotide multimers to be useful in diagnostics and medicine. The
CC   present sequence represents an oligonucleotide used in an example from
CC   the present invention

XX
PT   Synthesizing RNA oligonucleotide involves combining single-stranded
PT   circular oligonucleotide, ribonucleotide triphosphate and polymerase
PT   enzyme to yield desired RNA complementary to circular oligonucleotide
PT   template.
XX
PS   Example 2; SEQ ID NO 5; 78pp; English.
XX
CC   The invention relates to a method for synthesising an RNA
CC   oligonucleotide, comprising combining a single-stranded circular
CC   oligonucleotide template with at least two types of ribonucleotide
CC   triphosphate and a polymerase enzyme to yield a single-stranded RNA
CC   oligonucleotide multimer complementary to the circular oligonucleotide
CC   template, where the RNA oligonucleotide multimer comprises multiple
CC   copies of the desired RNA oligonucleotide. The method is useful for
CC   synthesising an RNA oligonucleotide with well-defined ends. The circular
CC   oligonucleotide is introduced into the cell using direct injection,
CC   electroporation, calcium phosphate treatment, lipid-mediated delivery, or
CC   cation-mediated delivery. The method is useful for treating bacterial
CC   and/or viral infections in mammals, particularly drug resistant
CC   infections, and for producing double stranded DNA oligomers. The method
CC   is performed in the absence of an oligonucleotide primer, or without the
CC   addition of auxiliary proteins. This sequence represents an
CC   oligonucleotide used in the method of the invention.

PT   Vaccinating against tumors, infectious diseases, allergies and asthma
PT   using immunostimulatory Py-rich and TG nucleic acids.
XX
PS   Claim 101; Page 56; 338pp; English.
XX
CC   The present invention relates to a method for stimulating an immune
CC   response. The method comprises administering an immunostimulatory nucleic
CC   acid to a non-rodent subject in sufficient quantity to stimulate an
CC   immune response. The present sequence is one such immunostimulatory
CC   nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
CC   (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
CC   against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
CC   and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,
CC   haemophilus, campylobacter, clostridium, Escherichia coli and/or
CC   staphylococcus), fungal antigens and/or parasitic antigens. The method is
CC   also useful for preventing cancer, asthma, infectious disease, allergy or
CC   immune deficiency. The present sequence can also be used to redirect a
CC   Th2 to a Th1 immune response and to activate immune cells. Note: the
CC   present sequence may have a phosphorothioate backbone

PT   Inhibiting angiogenesis in a subject, involves administering at least one
PT   antiangiogenic nucleic acid molecule to the subject.
XX
PS   Claim 2; Page 35; 276pp; English.
XX
CC   The invention relates to inhibiting angiogenesis in a subject, comprising
CC   administering at least one antiangiogenic nucleic acid molecule. Also
CC   included is a kit comprising a first container housing the antiangiogenic
CC   nucleic acids, and instructions for administering them to a subject
CC   having a condition characterised by unwanted angiogenesis. The method is
CC   useful for inhibiting angiogenesis associated with solid tumour growth,
CC   tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis,
CC   diabetic retinopathy, retinopathy of prematurity, macular degeneration,
CC   corneal graft rejection, neovascular glaucoma, retrolental fibroplasia,
CC   rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque
CC   neovascularisation, telangiectasia, haemophiliac joints, angiofibroma,
CC   wound granulation, intestinal adhesions, atherosclerosis, scleroderma and
CC   hypertrophic scars. The present sequence is an antiangiogenic nucleic
CC   acid of the invention

PT   Producing protein or DNA libraries which are useful for improving
PT   existing proteins, by in vitro translating protein coding sequences to
PT   produce RNA-protein fusions and incubating these protein fusions under
PT   high salt conditions.
XX
PS   Disclosure; Page 43; 121pp; English.
XX
CC   The present sequence is one of a number of oligonucleotides which were
CC   used for the generation of RNA-protein fusions, including fusions having
CC   a myc epitope tag. The RNA-protein fusions comprise a protein covalently
CC   linked to the 3' end of its own mRNA. This is accomplished by synthesis
CC   and in vitro or in situ translation of an mRNA molecule with a peptide
CC   acceptor attached to its 3' end. The RNA-protein fusions are incubated
CC   under high salt conditions to produce a protein library. This method is
CC   useful for improving or altering existing proteins, as well as for
CC   isolating new proteins and nucleic acid or small molecule targets. It may
CC   also be used to improve human or humanised single-chain antibodies for
CC   the treatment of a number of diseases. The method is useful for the
CC   isolation of proteins with specific binding properties, for screening
CC   cDNA libraries and cloning new genes on the basis of protein-protein
CC   interactions. Unlike prior art, the new method does not rely on
CC   maintaining the integrity of an mRNA:ribosome:nascent chain ternary
CC   complex, which is very fragile and is therefore of limited use. The
CC   method does not rely on topological links between the protein and the
CC   nucleic acid so that the information of the protein is retained and can
CC   be recovered in readable, nucleic acid form

PT   Encoding and sorting in vitro translated proteins, useful for the
PT   identification of desired binding partners, comprises attaching a nucleic
PT   acid linker to the protein and binding an encoding molecule to the
PT   linker.
XX
PS   Example 3; Fig 9B; 48pp; English.
XX
CC   The sequence represents part of a branched encoding molecule used in
CC   methods to hybridise a capture probe to the addressing element of a DNA
CC   linker attached to an in vitro translated protein, in order to immobilise
CC   the protein to a solid support. The new methods are useful for tagging or
CC   encoding in vitro translated proteins with unique and minimal encoding
CC   molecules and sorting these molecules onto solid supports. They are also
CC   useful for the identification of a desired binding partner. The method
CC   allows the use of pre-made sets of universal encoding molecules, such as
CC   nucleic acid(s) (analogues). These can be used in conjunction with
CC   corresponding universal microarrays or sets of microparticles to create
CC   new protein display systems which are flexible, modular, scalable and
CC   cost effective. The method allows the use of nucleic acid analogue which
CC   are not susceptible to enzymatic incorporation or polymerisation and are
CC   superior to conventional DNA/RNA. The proteins can also be labelled with
CC   fluorescent groups which can be used to monitor the protein in real time.
CC   The absence of RNA is advantageous as they can adopt secondary structures
CC   which are difficult to predict and can interfere with hybridisation steps
CC   and protein folding/function

PT   System for detecting immobilized analyte, useful e.g. for biomedical
PT   diagnosis, has as detection agent specific polypeptide coupled to nucleic
PT   acid for signal amplification.
XX
PS   Example; Page 6; 12pp; German.
XX
CC   This invention describes a novel test system (A) which comprises at least
CC   one immobilized analyte (I) on an insoluble carrier and a polypeptide
CC   detection agent (II), specific for (I) and conjugated, via a linker, to
CC   an amplifier (III). (A) is used for direct, in vitro detection of (I)
CC   with amplification of the signal by polymerase chain reaction (PCR), or a
CC   related technique, applied to (III). The method is useful in biomedical
CC   diagnosis and environmental monitoring and can be used to detect a wide
CC   range of (I), e.g. diagnostic or pharmaceutical agents, secondary
CC   metabolites, herbicides or pesticides. (A) allow simultaneous, parallel
CC   detection of many different analytes (high throughput capacity),
CC   relatively simply (only a few incubation and washing steps are required)
CC   and with high sensitivity and selectivity. This sequence represents
CC   primer used in the ampification of the c-myc DNA fragment which encodes
CC   an epitope used to illustrate the method of the invention

PT   Detecting and purifying biological material by (di)electrophoresis,
PT   useful e.g. for separating tissues and viruses, comprises using a probe
PT   that alters (di)electrophoretic properties.
XX
PS   Example 1; Page 12; 20pp; German.
XX
CC   The present invention relates to a method for the detection or
CC   purification of biological material by electrophoresis, which comprises
CC   (i) treating the biological material containing different species with a
CC   bioprobe and (ii) establishing an electric field for detection or
CC   purification of at least one complex formed between the biological
CC   material being tested and a specifically bound bioprobe. The method is
CC   used for detection and purification of tissue, cells, cell organelles,
CC   viruses, proteins, nucleic acids, lipids and/or other organic compounds.
CC   It can also be used for the isolation of specific bioprobes from a
CC   library of bioprobes. The present sequence is a linker described in the
CC   exemplification of the invention

XX
PT   Synthetic nucleic acid probes - comprising two nucleic acid sequences
PT   linked by a scissile linkage.
XX
PS   Example; p29; 46pp; English.
XX
CC   The patent claims a new molecule of formula (NA1----S----NA2)n. NA1 and
CC   NA2 are noncomplementary nucleic acid sequences; ---S--- = a scissile
CC   linkage; n= 1 or 1,000, which is used for the detection of specific DNA
CC   or RNA sequences in a test soln. The scissile link probes may be PL
CC   (Permanent Linkage to Solid Support) or HL (Hydrolysable Linkage to Solid
CC   Support). The differential liability of DNA and RNA may be exploited in a
CC   heterogenous system when the scissile linkage is an RNA molecule. In the
CC   examples, counter probe molecules 9 through 16 were used to determine
CC   suitable hybridisation conditions. (Updated on 03-OCT-2002 to add missing
CC   OS field.)

PT   Detecting target nucleic acid molecules - using excess complementary
PT   nucleic acid probes and nicking to complete a cycling sequence.
XX
PS   Disclosure; Page 24; 34pp; English.
XX
CC   Probe MRCO64 is bound by a hydrolysable linkage to a solid support at its
CC   3' end. It is used by reacting excess probe with a target nucleic acid;
CC   nicking hybridised probe at least once within a predetermined sequence to
CC   form 2 or more probe fragments hybridised to the target sequence, which
CC   results in the probe fragments becoming hybridised to another probe; and
CC   identifying probe fragments, so detecting the target sequence. The probe
CC   can react with target sequence to complete a cycling sequence. Using this
CC   system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can
CC   be obtd. The probe is cleavable at the ribonucleotides by a ds RNase, eg
CC   RNase H or ExoIII. (Updated on 31-OCT-2002 to add missing OS field.)

PT   Optical detection of hybridization complexes for specific target nucleic
PT   acid sequences.
XX
PS   Example 1; Page 40; 46pp; English.
XX
CC   This invention describes a novel method for the visual detection of
CC   target nucleic acid presence in a sample. A preferred target is a
CC   Mycobacterium complex nucleic acid sequence. The detection method uses
CC   visual detection of a change in the hybridization without aid of
CC   instrumentation. Multiple copies of a target nucleic acid sequence are
CC   mixed with first and second detectable probes under hybridizing
CC   conditions favouring particle agglutination via a bridging molecule
CC   allowing for visual detection of the target nucleic acid sequence. The
CC   bridging molecule enhances or inhibits formation of a hybridization
CC   complex

PT   Determining an analyte in a sample, for generating multiple double
PT   stranded nucleic acids, comprises employing a single primer sequence with
PT   a nucleobase sequence having affinity to the sequence contained in a
PT   target nucleic acid.
XX
PS   Example 1; Col 14; 25pp; English.
XX
CC   The invention relates to determining an analyte in a sample comprising
CC   (a) providing a target nucleic acid comprising a region A, a nucleobase
CC   sequence B, and a sequence I linked to the 5' terminus of the nucleobase
CC   sequence B, where the nucleobase sequence B is not specific for the
CC   analyte, and the region A specifically binds to the analyte, (b) binding
CC   the target nucleic acid to the analyte, separating the analyte bound to
CC   the target nucleic acid from the remaining part of the sample, (d)
CC   hybridising a primer to the target nucleic acid, where the primer
CC   comprises a nucleobase sequence B', and the nucleobase sequence B'
CC   hybridises to the nucleobase sequence B, (e) elongating the hybridised
CC   primer to produce an elongation product E using the target nucleic acid
CC   as a template and using nucleotides, where at least 30 % of the
CC   nucleotides contain at least one promiscuous base which is capable of
CC   base pairing with each of adenine, guanine, cytosine, and thymine, (f)
CC   separating the target nucleic acid from the elongation product E, (g)
CC   hybridising a further primer which comprises the nucleobase sequence B'
CC   to the elongation product E, where the elongation product E is capable of
CC   acting as a template for the elongation of the further primer, (h)
CC   elongating the hybridised further primer of step (g) to produce an
CC   elongation product E' using the elongation product E as a template and
CC   using nucleotides, where at least 30 % of the nucleotides contain at
CC   least one promiscuous base, (i) separating the elongation product E from
CC   the elongation product E', (j) hybridising a further primer comprising a
CC   nucleobase sequence B' to the target nucleic acid or the elongation
CC   product E, (k) elongating the further primer of step (j) to produce
CC   another elongation product E using the target nucleic acid or elongation
CC   product E as a template and using nucleotides, where at least 30 % of the
CC   nucleotides contain at least one promiscuous base, (l) separating product
CC   E of step (k) from the target nucleic acid or elongation product E, (m)
CC   optionally repeating steps (g) - (l) a sufficient number of times to
CC   generate a desired amount of double stranded nucleic acids and (n)
CC   determining the elongation product E and/or elongation product E' as a
CC   measure of the presence or amount of the analyte, where the lengths of
CC   the sequence I and the nucleobase sequence B are chosen such that, when
CC   the further primer hybridises to the elongation product E in step (g),
CC   the further primer spans a sequence formed by elongation of the
CC   hybridised primer of step (e) and overlaps at least a part of the 3'
CC   region of the hybridized primer of step (e) by an overlap length. The
CC   method is useful determining an analyte in a sample. In particular, the
CC   method is useful for generating multiple double stranded nucleic acids.
CC   The present sequence is a primer molecule used to exemplify the method of
CC   the invention

PT   Novel oligonucleotide label-domain for incorporation into oligonucleotide
PT   probes useful for detecting or localizing nucleic acid target genes
PT   within a cell or tissue sample.
XX
PS   Disclosure; Page 69; 71pp; English.
XX
CC   The present invention relates to a new oligonucleotide label-domain
CC   comprising the sequence (CTATTTT)_n and its complement (AAAATAG)_n, where
CC   n is 1. The probe sets of the invention are useful for detecting kappa or
CC   lambda-immunoglobulin light chain mRNA or corresponding heteronuclear
CC   RNA, CMV (cytomegalovirus) immediate early RNA, EBV (Epstein-Barr virus)
CC   early RNA 1 and RNA 2, and human Alu repetitive satellite genomic
CC   sequences. The invention is a useful generic sequence for incorporation
CC   into oligonucleotide probes for detecting gene-specific sequences within
CC   cells or tissue samples in in situ hybridisation analysis and for
CC   attaching a label to immunoglobulins or other proteins for detecting
CC   haptens and antigens in immunohistochemical analyses. The present nucleic
CC   acid sequence represents one of a collection (ABK70376-ABK70501) of
CC   oligonucleotide probes that were used in the invention for detecting or
CC   localising a plurality nucleic acid target gene or antigen within a cell
CC   or tissue sample

PT   Fluorescent dye or its salt, hydrate, solvate or stereoisomer for nucleic
PT   acid probe for measuring nucleic acid(s) containing specific nucleic acid
PT   sequence in sample, has specific formula.
XX
PS   Example 5; Page 33; 40pp; English.
XX
CC   The invention describes a novel fluorescent dye and method of detecting
CC   nucleic acid. The dye and method are useful for nucleic acid probes for
CC   measuring nucleic acid(s) containing a specific nucleic acid sequence in
CC   a sample, and for qualitative/quantitative assay of target RNA containing
CC   specific base sequence anticipated in gene mixture. The assay is useful
CC   in gene diagnosis and other areas of clinical diagnostics and in
CC   identification/quantification microorganisms in biological samples such
CC   as serum, plasma and urine, microbially contaminated samples from food,
CC   rooms, soil, rivers and sea. The fluorescent intercalative dye shows a
CC   large fluorescent enhancement upon intercalation into double-stranded
CC   nucleic acid, and shows a great difference between excitation and
CC   emission wavelengths (has a large Stokes shift) and does not have a
CC   fluorescent spectrum that overlaps with those of conventionally known
CC   fluorescent intercalation dyes. Viruses, microbial RNAs, specific
CC   sequences in one RNA, are detected or quantified in a short time, hence
CC   the detection method is applicable to clinical diagnosis which requires
CC   high reliability. Amplification and extraction efficiencies of the target
CC   nucleic acid, are checked. This sequence represents a synthetic DNA used
CC   as the target in an assay to detect double stranded DNA

PT   Selection of specific protein by screening protein-RNA fusions generated
PT   in vitro or in situ - useful for, e.g. identifying enzymes and antibodies
PT   with altered properties, potentially useful as catalysts or for therapy
PT   or diagnosis.
XX
PS   Disclosure; Page 39; 94pp; English.
XX
CC   The Oligonucleotides AAV48087, AAV48089-V48091 and AAV48096-V48098 and
CC   variations were used to generate RNA-protein fusions. These were used in
CC   the selection of a specific protein or RNA, by in vitro or in situ
CC   translation of candidate RNA molecules to produce RNA-protein fusions,
CC   then selecting specific RNA protein fusions. The method is used to select
CC   proteins (or DNA encoding them) having altered properties, e.g. for
CC   identification of new binding reagents, to identify improved human
CC   antibodies or new enzymes. These proteins are potentially useful in
CC   diagnosis and therapy, or as industrial catalysts. The methods allow many
CC   rounds of selection and amplification to be performed, resulting in
CC   enrichment of even very rare molecules and allowing isolation of proteins
CC   that bind specifically to almost any compound or catalyse almost any
CC   reaction

PT   Synthesis of branched polymers and novel branched polymeric structures -
PT   used as molecular probes esp. for detecting poly-nucleotide(s).
XX
PS   Example 8; Page 33; 52pp; English.
XX
CC   The sequences given in AAQ83938, AAQ83952 and AAQ83940 are used in the
CC   construction of an oligonucleotide clamp. The clamp is a comb-type
CC   branched polymer which has 3' termini and was used to bind a target
CC   sequence comprising a segment of the HIV pol and nef genes in single
CC   stranded or double stranded forms. An oligonucleotide clamp is a compound
CC   capable of forming a covalently closed macromolecule or a stable circular
CC   complex after specifically binding to the target polynucleotide.
CC   Oligonucleotide clamps generally comprise one or more oligonucleotide
CC   moieties capable of specific binding to the target molecule and one or
CC   more pairs of binding moieties covalently linked to the oligonucleotide
CC   moieties. Upon annealing of the oligonucleotides moieties to the target
CC   polynucleotide, the binding moieties of a pair are bought into
CC   juxtaposition so that they form a stable covalent or non-covalent linkage
CC   or complex. The interaction of the binding moieties effectively clamps
CC   the specifically annealed oligonucleotide moieties to the target
CC   polynucleotide. (Updated on 25-MAR-2003 to correct PN field.)

PT   Synthesizing branched nucleic acids useful as diagnostic and molecular
PT   probes, involves combining first units having haloalkylamino groups and
PT   second units having thiol or phosphorothioate groups.
XX
PS   Example 8; Col 19; 20pp; English.
XX
CC   The present invention relates to a method for synthesising a branched or
CC   multiply connected macromolecular structure, comprising oligonucleotide
CC   clamps (OC). The macromolecular structure is capable of specifically
CC   binding to a target molecule, and can therefore be used as probes. At
CC   least one OC comprises a target binding sequence that binds specifically
CC   and stably with the target molecule, and at least two OCs comprise signal
CC   generation moieties capable of generating a detectable signal in the
CC   presence of the target molecule. In addition the OCs are connected to one
CC   another by thioalkylamino, or thiophosphorylalkylamino bridges. The
CC   present sequence is an OC used in the present invention

PT   Isolating chemically regulatable DNA sequences in plants - useful for
PT   chemically controlling expression in transformed plants.
XX
PS   Example 72; Col 96; 175pp; English.
XX
CC   This sequence represents a primer used to isolate the tobacco
CC   pathogenesis-related (PR) gene. The PR gene can be isolated using the
CC   method of the invention. The method is for isolating a chemically
CC   regulatable DNA promoter fragment from the 5' flanking region of a
CC   chemically regulatable gene in a plant tissue. The method allows
CC   isolation of sequences which will be useful for the controlled expression
CC   of genes, under the control of a non-coding regulatable sequence. This is
CC   useful in plants with a herbicide or pesticide detoxification mechanism
CC   under the control of a chemical regulator, the regulator being applied
CC   before or with the herbicide or pesticide to give optimal tolerance. The
CC   promoter fragment is useful for controlling sequences which encode traits
CC   such as height, shape, development, male or female sterility, and the
CC   ability of the plant to withstand cold, heat, salt and drought. The
CC   chemical induction of the promoter allows the regulation of production of
CC   compounds, e.g. flavours, fragrances, pigments, natural sweeteners,
CC   industrial feedstocks, antimicrobials and pharmaceuticals, by
CC   biosynthesis or metabolite conversion, whose biosynthesis is controlled
CC   by endogenous or foreign genes. The method allows control over the time
CC   and rate of gene expression either throughout the whole plant, or in
CC   localized tissues, to achieve e.g. fungal or insect resistance by for
CC   instance dusting the leaves with the chemical regulator. Controlling the
CC   developmental processes by the application of a regulating chemical in
CC   e.g. the commercial production of cultivated crops allows processes such
CC   as germination, flower formation and fruit ripening to be synchronised at
CC   a given time

PT   DNA encoding pathogenesis-related glucanase proteins - useful for
PT   producing transgenic plants with enhanced disease or pest resistance.
XX
PS   Example 72; Col 93; 169pp; English.
XX
CC   The present invention describes a DNA molecule encoding a pathogenesis-
CC   related (PR) protein having beta-1,3-glucanase activity selected from PR-
CC   2, PR-2', PR-2'', PR-N, PR-O and PR-O'. Also described are: (i) a
CC   chimeric gene comprising the above DNA molecule linked to a heterologous
CC   promoter; (ii) a vector containing the chimeric gene; (iii) a host cell
CC   containing the chimeric gene; (iv) a transgenic plant containing the
CC   chimeric gene; and (v) a seed from the transgenic plant. The DNA molecule
CC   is used to produce transgenic plants with enhanced disease or pest
CC   resistance. The present sequence represents an oligonucleotide from the
CC   present invention

PT   Modifying nucleotide sequence, including recombination of genes in (non-
PT   )human cell, comprises introducing DNA-modifying molecule into cell cycle
PT   synchronized cell.
XX
PS   Example 4; Page 49; 67pp; English.
XX
CC   The specification describes a method for modifying a nucleotide sequence
CC   in the genome of a cell. The method comprises providing a cell and a DNA-
CC   modifying molecule, manipulating the cell to generate a synchronized cell
CC   and contacting the synchronized cell with the DNA-modifying molecule
CC   under conditions such that a modification in the nucleotide sequence is
CC   produced. The method is useful for modifying nucleotide sequences in the
CC   genome of a human or non-human cell including a fertilized egg cell from
CC   an animal such as sheep, pig, rabbit, cattle and a mouse cell such as
CC   blastomere, eight-cell embryo cell, blastocoele, midgestation embryo cell
CC   and embryonic stem cell. The cell is preferably DNA repair-deficient. The
CC   method is useful for introducing a modification into the genome of a cell
CC   for determining the effect of the modification on the cell. The method
CC   generates transgenic cells and animals useful as models for diseases, and
CC   for screening therapeutic agents. The method also facilitates targeted
CC   recombination for producing gene knockout organisms and/or replacement of
CC   detective genes with non-defective genes. Further the method is useful
CC   for determining the function of a gene of unknown function. AAI65861-62
CC   represent triplex forming oligonucleotides, which were used in the method
CC   of the invention to modify a fragment of the Hprt gene

PT   Detecting target nucleic acid molecules - using excess complementary
PT   nucleic acid probes and nicking to complete a cycling sequence.
XX
PS   Disclosure; Page 24; 34pp; English.
XX
CC   Probe MRCO68 is bound by a hydrolysable linkage to a solid support at its
CC   3' end. It is used by reacting excess probe with a target nucleic acid;
CC   nicking hybridised probe at least once within a predetermined sequence to
CC   form 2 or more probe fragments hybridised to the target sequence, which
CC   results in the probe fragments becoming hybridised to another probe; and
CC   identifying probe fragments, so detecting the target sequence. The probe
CC   can react with target sequence to complete a cycling sequence. Using this
CC   system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can
CC   be obtd. The probe is cleavable at the ribonucleotides by a ds RNase, eg
CC   RNase H or ExoIII. (Updated on 31-OCT-2002 to add missing OS field.)

PT   Detecting a label comprising employing (as the label) a reagent having a
PT   3' extendable terminus hybridized to a tandem repeat template in
PT   combination with a DNA polymerase and dNTPs necessary for repetitively
PT   replicating the tandem repeat.
XX
PS   Example; SEQ ID NO 2; 38pp; English.
XX
CC   The invention relates to a method for detecting a label, comprising
CC   employing (as the label) a reagent having a 3' extendable terminus
CC   hybridised to a tandem repeat template in combination with a DNA
CC   polymerase and dNTPs necessary for repetitively replicating the tandem
CC   repeat. The method involves detecting a binding event between first and
CC   second binding members, employing a label to determine the occurrence of
CC   the binding event. The tandem repeating units are polyT. The method of
CC   the invention is useful in detecting an analyte using repetitive
CC   extension along a tandem repeat. The extended nucleic acid may be used
CC   for detecting a moiety, particularly involved in a binding event
CC   employing a reagent. The current sequence represents a template member
CC   oligonucleotide containing a polyT tandem repeat that binds to the
CC   extendable oligonucleotide given in ADC33444.

PT   New pure contryphan peptides.
XX
PS   Example 3; Page 20; 48pp; English.
XX
CC   The present sequence sequence represents a PCR primer for a contryphan
CC   peptide sequence. Contryphan peptides are found in the venom of cone
CC   snails. The contryphan peptides are useful as anticonvulsant agents, as
CC   neuroprotective agents, for managing pain, and for treating
CC   neurodegenerative disorders, especially those resulting from an
CC   overstimulation of excitatory amino acid receptors. The contryphans are
CC   useful for the treatment and alleviation of epilepsy and as a general
CC   anticonvulsant agent. The contryphans are also useful to reduce
CC   neurotoxic injury associated with conditions of hypoxia, anoxia, or
CC   ischaemia which typically follows stroke, cerebrovascular accident, brain
CC   or spinal chord trauma, myocardial infarct, physical trauma, drownings,
CC   suffocation, perinatal asphyxia, or hypoglycaemic events. The contryphans
CC   are further useful for the treatment of Alzheimer's disease, senile
CC   dementia, amyotrophic lateral sclerosis, Parkinson's disease,
CC   Huntington's disease, Down's syndrome, Korsakoff's disease,
CC   schizophrenia, AIDS dementia, multi-infarct dementia, and neuronal damage
CC   associated with uncontrolled seizures. The contryphans are further useful
CC   in controlling pain and are effective in the treatment of migraine. They
CC   can be used prophylactically or to relieve the symptoms associated with a
CC   migraine episode

CC   generic formula, in the 3'-5' or 5'-3' direction: (GaTa')a''-(GbTb')b''-
CC   (GcTc')c''-(GdTd')d''-(GeTe')e''-(GfTf')f''- (G-gTg')g''-N', where: N and
CC   N' = T or G, equal or different from each other; x = 0-8, equal or
CC   different from each other; a, b, c, d, e, f, and g = 0-10, equal or
CC   different from each other; a', b', c', d', e', f', and g' = 0-30, equal
CC   or different from each other; a'', b'', c'', d'', e'', f'', and g'' = 1-
CC   16, equal or different from each other; The oligonucleotides are believed
CC   to selectively bind and sequester some proteins which are essential to
CC   the viability and growth of tumoural cell line. They have specific and
CC   selective cytotoxic activity against tumour cells, and can be used for
CC   treating tumours of the liquid type, in particular of lymphoblastic
CC   origin, and of solid type, in particular lymphomas. The present
CC   phosphodiester oligonucleotide, at a concentration of 15 micromolar,
CC   reduced growth of CCRF-CEM tumoural cells by 71%, which is detectable 48
CC   hours after administration. (Updated on 25-MAR-2003 to correct PR field.)

XX
CC   The present invention provides the protein and coding sequences of a
CC   number of human reproductive system related antigens. These can be used
CC   in the prevention and treatment of reproductive system disorders,
CC   including cancer. The present sequence is a genomic sequence encoding a
CC   protein of the invention

PT   Vectors expressing full-length gene of RNA viruses, useful in clarifying
PT   mechanisms of RNA viral replication, infection, and developing remedies
PT   and therapeutics.
XX
PS   Example 2; Page 20; 46pp; Japanese.
XX
CC   The present invention describes a vector comprising a cDNA encoding an
CC   RNA virus gene, constructed to ensure the exact and homogeneous
CC   transcription of both terminals of the RNA virus gene. Also described is
CC   a method for screening drugs for inhibiting the replication of RNA virus
CC   by using the RNA viral infection model animal, particularly one with
CC   hepatitis C viral infection. The vector is useful in clarifying the
CC   mechanism of RNA viral replication, onset of RNA viral infection, and
CC   developing remedies and therapeutics for RNA viral infections,
CC   particularly of a hepatitis C virus. The present sequence represents a
CC   PCR primer which is used in the exemplification of the present invention

PT   Compsn. contg. 5-thiolated (oligo-poly-)-nucleotide(s) - for treating HIV
PT   infection, AIDS and for preventing HIV-1 infection.
XX
PS   Disclosure; Page 11; 42pp; English.
XX
CC   The oligomer comprises a non-thiolated (binding) homooligonucleotide
CC   region ( d(T)12 ) to promote the binding of the remaining portion of the
CC   5-thiolated oligonucleotide ( MdU_28 ) to a homopurine site of the viral
CC   genome via triple-helix formations. The oligo is used to in the treatment
CC   of HIV. See also AAQ22624-27 and AAQ25017-Q25032

PT   Enhancing translation of coding region of hepatitis C virus involves
PT   making RNA molecule comprising the coding region and 5' untranslated
PT   region comprising a sequence fully homologous to pestivirus homology box
PT   IV.
XX
PS   Disclosure; Col 19-20; 16pp; English.
XX
CC   This invention describes a novel method for enhancing translation of a
CC   coding region which involves making an RNA molecule, comprising the
CC   coding region operably linked to a 5' untranslated region (UTR)
CC   comprising a sequence fully homologous to pestivirus homology box IV, and
CC   then translating it so that the translation of the coding region is
CC   enhanced. The method is useful for enhancing or controlling the
CC   translation of HCV nucleic acid, which allows stronger immune responses,
CC   where blocking or decreasing translation of viral nucleic acid may
CC   decrease the pathology of viral infection. This sequence represents a
CC   primer which is used in the construction of hybrid CAT RNA's described in
CC   the method of the invention

PT   Mutant strains of swine vesicular disease virus (SVDV) used in vaccines
PT   to prevent swine vesicular disease.
XX
PS   Example 2; Page 6; 66pp; English.
XX
CC   This sequence represents a PCR primer used to determine the full length
CC   cDNA sequence of the swine vesicular disease virus (SVDV) gene sequence
CC   of Taiwan Yu-Li strain (see AAZ98717). SVDV is the causative agent of
CC   swine vesicular disease, which is very similar to foot and mouth disease.
CC   The invention relates to the wild-type Taiwan Yu-Li strain cDNA sequence,
CC   and the gene sequences of the mutant SVDV strains N3, H21 and SP7. The
CC   mutant SVDV nucleotide sequence can be used in a vaccine for the
CC   prophylaxis of swine vesicular disease. The invention also includes a
CC   method for differentiating the mutant SVDV nucleotide sequences from the
CC   wild type strain of SVDV, coxsackievirus and foot-and-mouth disease virus
CC   through the use of polymerase chain reaction

PT   PTAN proteins, and sequences encoding them, used for diagnosing and
PT   treating cancers, especially breast and prostate cancers.
XX
PS   Example 1; Page 31; 71pp; English.
XX
CC   This sequence represents a primer used in the isolation of cDNA fragments
CC   of the PTAN (testis specific protein expressed in prostate cancer) gene.
CC   PTAN is expressed in 3 isoforms PTAN-1, 2, and 3. The PTAN gene is
CC   located on chromosome 1q22. PTAN is overexpressed in prostate cancer, and
CC   has a testis specific expression pattern in adult tissues. PTAN shows no
CC   homology to any known gene. PTAN can be used in methods for the diagnosis
CC   of cancer, especially prostate or breast cancer, where the normal tissue
CC   samples are prostate tissue, or breast tissue, bone tissue, lymphatic
CC   tissue, serum, blood, or urine. A vector containing the PTAN nucleotide
CC   sequence, a vaccine composition targeting PTAN, PTAN, ribozymes specific
CC   for PTAN mRNA and antisense sequences, can be used to treat cancer,
CC   especially breast and prostate cancers. Cancer development can be
CC   inhibited by a vaccine composition targeting PTAN

PT   An improved multiplex ligation-dependent amplification method for
PT   detecting specific single stranded target nucleic acids in samples.
XX
PS   Example 8; Page 137; 158pp; English.
XX
CC   The invention relates to an improved multiplex ligation-dependent
CC   amplification method for detecting specific single stranded target
CC   nucleic acids in samples using a plurality of probe sets comprising at
CC   least 2 probes. Each probe comprises a target specific region and a non-
CC   complementary region comprising a primer binding site. The probes in each
CC   set are ligated when hybridised to a target nucleic acid and amplified by
CC   a primer set. The method is used for detecting a nucleotide polymorphism,
CC   especially a single nucleotide polymorphism; detecting multiple single
CC   stranded target nucleic acid sequences (through the detection of multiple
CC   amplicons); determining the absolute or relative abundance of multiple
CC   single stranded nucleic acids in a sample; and detection of a break point
CC   region in rearranged nucleic acids. By using a femtomolar amount of the
CC   probes, a large number of different probe sets can be used to
CC   simultaneously detect and quantify a corresponding large number of target
CC   sequences with high specificity. The present DNA sequence is biotin-dT3
CC   labelled fluorescent oligonucleotide which is used for the hybridisation

PT   Array containing probes for genes involved in mitochondrial biology,
PT   useful for determining mitochondrial biology gene expression profiles for
PT   use in diagnosing pathologies and identifying biochemical pathways.
XX
PS   Claim 2; SEQ ID NO 1564; 201pp; English.
XX
CC   The invention relates to a novel array comprising at least two isolated
CC   nucleotide molecules, each molecule having a sequence capable of uniquely
CC   hybridising to a nucleic acid molecule which is an expression product of
CC   a gene involved in mitochondrial biology. The array comprises two or more
CC   isolated nucleic acid molecules or spots, each molecule having a sequence
CC   chosen from sequence of 994 human probes and 2046 mouse probes. An array
CC   of the invention is useful for determining an expression profile of a
CC   mouse or human sample containing nucleic acid, by contacting the array
CC   with the sample under conditions allowing selective hybridisation, and
CC   measuring hybridisation of nucleic acid in the sample to the array to
CC   produce an expression profile. The array is also useful for determining
CC   an expression profile of a first labelled sample containing nucleic acid
CC   relative to a second, differently labelled sample containing nucleic
CC   acid. The second sample is a reference or a standard. An array is useful
CC   for determining an expression profile diagnostic of an energy-metabolism-
CC   related physiological condition. An array of the invention is useful for
CC   determining mitochondrial biology gene expression profiles of organisms,
CC   such as human, mice and closely related species, tissue and organs of
CC   such organisms, which are useful for determining expression profiles
CC   diagnostic of energy metabolism-related physiological conditions,
CC   diagnosing such physiological conditions, identifying biochemical
CC   pathways, genes, and mutations involved in such physiological conditions,
CC   identifying therapeutic agents useful for preventing and/or treating such
CC   physiological conditions, evaluating and/or monitoring the efficacy of
CC   such therapies, and creating and identifying animal models of human
CC   energy metabolism-related physiological conditions. An array is also
CC   useful for defining expression signatures or profiles for mitochondrial
CC   diseases, as well as distinguishing clinical disorders that result from
CC   oxidative phosphorylation (OXPHOS) dysfunction, oxidative stress,
CC   apoptosis and aging. An array of the invention contains probes of genes
CC   not previously recognised to participate in mitochondrial biology. The
CC   sequences shown in ADD33224-ADD35260 represent murine mitochondrial DNA
CC   clones used to make the probes of the invention. Some sequences are not
CC   present, these are SEQ ID NO's 295, 1174, 1213, 1700, 1728, 1730, 1905,
CC   1906, 2408 and 2643.

XX
CC   A method for the analysis of cDNA comprises (a) preparing an aggregate of
CC   double-stranded cDNAs by using an aggregate of mRNAs and a plural type of
CC   labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)
CC   and using the aggregate of mRNAs as the template for each reverse
CC   transcription primer; (b) digesting each of the prepared aggregates of
CC   the double-stranded cDNAs with restriction enzyme and; (c)
CC   electrophoresing the digested aggregate of cDNAs in seperate lanes. The
CC   method can be used to analyse gene expression rapidly and easily
